Arboricultural Impact Assessment

Proposed Development Llys Wern II Caerwen, Neath SA10 7PR

Introduction

The site is bounded on the northwest by an old hedge banks with trees and understory shrubs.

A tree survey was undertaken by David Rice Forestry on 18 05 2018 (see separate document).

Impact on existing trees

The proposed dwelling layout does not impinge on the boundary trees. The proposed footway is outside the root protection areas of all trees except T 15 willow and T16 common alder. The intrusion is < 20% in each case and is considered acceptable

Trees works

All the recommended work is to encourage revitalization of old or partially moribund specimens and to reduce winter wind resistance by killing ivy.

Retained trees

The retained trees will be protected during the construction phase. See Arb Method Statement of 02 10 2018

David Rice
