

Semi-natural broad-leaved Woodland

Semi-natural broad-leaved woodland is mostly located on steeply sloping ground. The largest areas are dominated by mature Sessile Oak, with a sparse understorey of Rowan, Holly, Hazel and Hawthorn. This is mostly attributable to the NVC category W11 *Quercus petraea* – *Betula pubescens* – *Oxalis acetosella* woodland. Quadrats 70, 81 and 82 are from typical examples of this habitat. Frequent ground flora species include Creeping Soft-grass, Bluebell and Wood Sorrel. Q2 is an example of Oak woodland on a damp valley-side where Alder is also prominent. Q5 is an example of Sessile Oak woodland with a very species-poor ground flora, due to grazing by sheep.

On lower valley-sides to the south there is semi-natural Ash-dominated woodland with a relatively diverse ground flora that includes a number of old woodland indicator species such as Bluebell, Yellow Pimpernel, Wood Speedwell and Tutsan. Only one quadrat was recorded from this woodland (Q18) as it is outside the likely works area. This is best classed as W9 *Fraxinus excelsior* – *Sorbus aucuparia* – *Mercurialis perennis* woodland.

W11 Sessile Oak woodland (Q82). This particular woodland is included in the Natural Resources Wales Ancient Woodland Inventory.

W9 Ash woodland (Q18).

Plantation and scrub woodland

Some of the broad-leaved woodland shown on the habitat map comprises plantation woodland, planted as part of coal spoil restoration projects. Canopy species including Field Maple and Grey Alder are frequent in the plantations but would not be expected to occur in these situations naturally. Other relatively new woodland appears to have established from scrub on damp ground. For the purposes of this study these younger woodlands have been grouped together. Quadrats 53, 68 and 83 appear to have been established as plantations. Quadrats 20 and 86 are examples of scrub woodland (which may have been planted) and Quadrat 1 is an example of young Alder woodland.

These woodlands are all characterised by a high proportion of Bramble in their understorey, and there are often remnants of grassland flora persisting in the shade (e.g. Red Fescue, Soft Rush, Common Bent, Common Spotted Orchid). They mostly lack old-woodland indicator species, although a few, such as Wood Sedge, Enchanter's Nightshade and Wood Avens occur locally. Broad-leaved Helleborine orchids are present in many of the young woodlands on coal spoil; often in large numbers.

These young woodlands are difficult to place within the NVC because they are in a transitional state between scrub and woodland. The plantations have a man-made canopy composition and most of the young woodlands have grassland elements in the ground flora. W21 *Crataegus monogyna* – *Hedera helix* scrub is a reasonable match for much of the plantation woodland, while some damper scrub woodland has elements of W6 *Alnus glutinosa* – *Urtica dioica* woodland (e.g. Q11).

There were relatively few noteworthy plant species in the young woodlands, but a large plant of Sherard's Downy Rose (or a possible hybrid of it) was seen at a track-side scrub margin south of Quadrat 68. Several non-native invasive *Cotoneaster* species, particularly Hollyberry *Cotoneaster*, were also seen in young woodlands.

Broad-leaved plantation (Q53)

Conifer plantation

Conifer plantations were not sampled using quadrats, because the dense tree canopy only supports a sparse ground flora and the plant community was not expected to have much value for nature conservation value. A walk-through of the plantation at the north-west of the study area found that although the vegetation beneath the canopy of Lodgepole Pine, Larch and Sitka Spruce was sparse it was of at least local value due to a very large population of Common Wintergreen (with many thousands of plants present). The moderately diverse range of other species in the ground flora was dominated by mosses and liverworts. Frequent seedlings of Sessile Oak and Downy Birch may give an indication of the type of woodland that might develop in this area naturally.

Table 5. Species-list for coniferous plantation (TN12)

Coniferous plantation (TN12), showing large numbers of Common Wintergreen plants in otherwise sparse ground flora.

Acid grassland

At this site acid grassland typically exists as part of a mosaic with marshy grassland and heath vegetation. It tends to occur patchily, especially on well-drained sloping ground, where succession to heath is limited by grazing. Much of it also varies in the openness of the sward, depending on slope and grazing intensity. In some cases, where it is developing on relatively young coal spoil it may also be a transitional stage that might eventually become heath. Much of the acid grassland within the site would be best classified semi-improved acid grassland (which is discussed later) due to the heavy grazing of sheep and likely past influences of reprofiling and soil conditioning work carried out to restore coal spoil.

In terms of the NVC the acid grassland forming relatively open swards on dry, stony slopes and spoil heaps is best assigned to U1 *Festuca ovina* – *Agrostis capillaris* – *Rumex acetosella* grassland. It supports a relatively high proportion of annuals, bryophytes and lichens. However, it differs from the typical published U1 community as Sheep's Sorrel is relatively scarce.

Table 6. Quadrat data for U1 *Festuca ovina* – *Agrostis capillaris* – *Rumex acetosella* dry acid grassland.

Dry U1 acid grassland on a former railway embankment (Q57)

Neutral grassland

Neutral and semi-improved neutral grassland at this site is mostly limited to small patches and road-side strips, where there is more base-enrichment in soils than the more prevalent acid grassland communities. In this case it is likely that the base minerals have originated from shale in coal waste or limestone associated with road building, and this is especially likely with the developing grasslands at the washery (Quadrats 98, 99 and 100). Most are probably best classified as 'unimproved' neutral grassland because it is unlikely that there has been any intentional grassland improvement in most of these areas, except occasional grass cutting. There is a wide range of species in these rather fragmented habitats, reflecting the mix of acid and base minerals in the soils derived from coal spoil. In terms of the NVC the neutral grassland communities are probably closest to MG5 *Centaurea nigra* - *Cynosurus cristatus* grassland, although some patches of rougher, unmanaged grassland are closer to MG1 *Arrhenatherum elatius* grassland (which was more species-poor and not sampled). In addition to the species recorded in the quadrats, the neutral grassland also included small amounts of Restharrow, Cowslip and Hairy Tare.

MG5 neutral grassland beside access track (Q87)

Semi-improved acid grassland

A high proportion of the heavily grazed, short grassland on the site is best classified as semi-improved acid grassland. Most is grazed by sheep and cattle, but a few fields near the washery (represented by Quadrats 119, 124, 126 and 127) are grazed by horses. One of the features of the older semi-improved grassland is the abundance of ant-hills. For the purposes of this study the 'ant-hill grassland' was sampled separately from the other semi-improved acid grassland, because of its very distinct appearance. This fits the NVC community U4 *Festuca ovina* – *Agrostis capillaris* – *Galium saxatile* grassland.

Table 8. Quadrat data for semi-improved acid 'ant-hill' grassland.

U4 semi-improved acid grassland with abundant ant-hills (Q6)

Other semi-improved acid grassland is present that also has a closed sward but does not support the same frequency of ant-hills. Some of this is of relatively recent origin (the large spoil heap where Q30 and 37 were recorded is only about 30 years old). Some appears to be on natural clay soil rather than coal spoil, and with a high proportion of Sweet Vernal-grass, Red Fescue and Crested Dog's-tail is close to MG5 semi-improved neutral grassland (e.g. Q69, 79 and 80). Much of the semi-improved grassland has patchy rushes (especially Soft Rush), and some is transitional with damp grassland (e.g. Q35, which has a high frequency of Purple Moor-grass and has affinity with M25 mire). A few areas with more prominent Mat Grass resemble U5 *Nardus stricta* – *Galium saxatile* grassland. However, the majority of this close-sward acid grassland still broadly conforms to the NVC community U4 *Festuca ovina* – *Agrostis capillaris* – *Galium saxatile* grassland.

Low-diversity U4 semi-improved acid grassland (Q23)

Sparse grassland on coal spoil and washery sidings

Much of the study area supports sparse vegetation on recently disturbed coal spoil. Similarly, the railway sidings at the washery support sparse vegetation on the limestone ballast forming the tracks, which is also mixed with fine material from the coal. The flora supports a high proportion of annual and low-growing ruderal species, as well as early colonists more typical of heath and grassland vegetation, and seedlings of trees and scrub. Bryophytes and lichens are also locally prominent. The flora supports many species indicative of acid soils, but there are many base-loving species too. This mix is typical of coal spoil and results in a very variable, flower-rich and often high diversity flora. In Phase 1 habitat classification this would usually be classified as 'ephemeral/ short perennial vegetation', although it is often not freely draining as the shale in the coal spoil breaks down into clays. It is not easy to define in terms of the NVC, probably because of the wide variation in the range of species that co-exist on the coal spoil and the presence of so many base-loving plants. The closest matches are probably U1 *Festuca ovina* – *Agrostis capillaris* – *Rumex acetosella* grassland community (Quadrats 38 and 72 are good examples of a typical U1 flora on coal spoil), but much of the spoil flora bears little resemblance to U1 and is probably best left unclassified.

Sparse vegetation on coal spoil (Q38).

Flower-rich sward on recently colonised coal spoil at the washery, with abundant Bee Orchids (near Q115).

While the Onllwyn sidings and washery spoil support a diverse ephemeral / short perennial community on the drier ground, there are damper areas within this area that support a higher proportion of wetland plants. Two quadrats from this vegetation are presented separately from the others because they are clearly developing towards a damp grassland flora rather than acid grassland or heath. Southern Marsh-orchids, Ragged Robin and a variety of sedges are a prominent feature of most of the damp areas of developing grassland at the washery. The locally rare plant Brookweed is associated with several damp areas by the sidings.

This damp, base-enriched grassland has similarities to some sand dune slack vegetation (e.g. SD15 or SD17), or forms of the M22 mire community. However, it is not a close match for any of the published NVC communities.

Developing damp grassland at the washery, with Ragged Robin and Southern Marsh-orchids (near Q112)

Dry heath

Heath is a feature of several areas on older coal spoil, especially where it has not been limited by grazing or shaded by scrub. The largest stands of heath are in the centre of the site which supports a mix of dry heath, wet heath and marshy grassland. Dry heath is also found on steeper slopes of coal spoil, often forming a mosaic with acid grassland (e.g. in Quadrats 40, 60, 73 and 113). Most stands of dry heath are dominated by Common Heather and readily conform to the published NVC community H1 *Calluna vulgaris* – *Festuca ovina* heath.

Ungrazed H1 dry heath, with patchy scrub (Quadrat 52).

Wet heath/ marshy grassland mosaic

Wet heath is not a common feature within the site, and where it occurs it is generally a fragmentary form within a mosaic of marshy grassland and mire vegetation. The examples sampled are all dominated by Purple Moor-grass, and the shrubs are a relatively minor element. In terms of the NVC this type of vegetation is best classified as M25 *Molinia caerulea* – *Potentilla erecta* mire (possibly close to the M25a *Erica tetralix* sub-community)

Sphagnum-rich bog vegetation

Several wet areas with Cotton-grasses and *Sphagnum* mosses are present around the margins of the restored coal workings, typically only in small quantity and/or filling ditches. The peaty substratum supports a number of species typical of upland peat bogs, including Common Cotton-grass, Hare's-tail Cotton-grass, Star Sedge, White Sedge, Round-leaved Sundew and a good number of *Sphagnum* species, locally with standing water and Bog Pondweed in wetter parts. A young plant of Royal Fern was also found in this habitat. Only two quadrats were collected from this vegetation. Quadrat 48 is from a bog pool and Quadrat 42 is from a ditch. Both are probably forms of the published NVC community M6 *Carex echinata* - *Sphagnum fallax*/ *S. denticulatum* mire.

Sphagnum-rich vegetation with Sundews (near Q42).

Marshy grassland

The most frequent type of marshy grassland on the site is dominated by Purple Moor-grass and subject to sheep-grazing. It tends to form a mosaic with species-poor semi-improved acid grassland and rush-dominated areas over large areas in the south and west of the site. The associated species are mostly grasses, sedges and rushes, with a very low proportion of flowering herbs.

Within the NVC this mosaic probably represents a wide spectrum of transitional stages between M25 *Molinia caerulea* – *Potentilla erecta* mire, M23 *Juncus effusus/ acutiflorus* – *Galium palustre* rush pasture, and U4 *Festuca ovina* – *Agrostis capillaris* – *Galium saxatile* grassland.

Some of the marshy grassland within the site is species-poor and dominated by rank Purple Moor-grass, and this is particularly found in areas where sheep have been excluded. The following examples were all ungrazed at the time of the survey, and supported tall, tussocky Purple Moor-grass. In terms of the NVC they are probably best described as a very species-poor M25 *Molinia caerulea* – *Potentilla erecta* mire, although the amount of Tormentil and other associated species is much lower than the typical form of this community due to the dominance of the Purple Moor-grass. NB The presence of the Sweet Chestnut, Pedunculate Oak and Rowan in association with Quadrat 90 is due to the area being used for tree planting, which is presumably why sheep have been excluded.

A high proportion of the extensively sheep-grazed marshy grassland in the south west of the site, and beside many of the damp ditch margins, is dominated by tall rushes, particularly Sharp-flowered Rush and Soft Rush. Purple Moor-grass is present but not dominant. These damp grassland habitats sometimes support a moderate number of flowering herbs such as Greater Bird's-foot Trefoil, Lesser Skullcap, Bog Stitchwort and Marsh Thistle, and occasional ferns. Within the NVC this grassland is best categorised with M23 *Juncus effusus/ acutiflorus* – *Galium palustre* rush pasture.

Table 17. Quadrat data for M23 marshy grassland with dominant rushes.

M23 rush pasture dominated by Sharp-flowered Rush (Q3).

Rush-dominated marshy grassland on the recently restored parts of the site tend to be heavily sheep-grazed and form a mosaic with species-poor semi-improved grassland. The vegetation has a very low proportion of flowering herbs and is generally not of nature conservation significance. However, it covers a relatively large area, so several quadrats were recorded from it to describe it and help to illustrate the variation within the range of marshy grassland types on the site. It is best classified as the NVC community MG10 *Holcus lanatus* – *Juncus effusus* rush pasture. It differs slightly from the published community as it has a lower proportion of Creeping Bent and Creeping Buttercup, but both species are present and the difference may just be due to the young age of the grassland, the intensity of the sheep grazing or some other local factor.

Species-poor MG10 rush pasture on the recently restored parts of the site (near Q88)

The marshy grassland flora in and around the washery has a very different character to the other marshy grassland within the study area. This is partly because it is grazed by horses rather than sheep, and also probably because the substratum is base-rich but acidic coal waste rather than natural soil. This marshy grassland has a very diverse sward, characterised by a high proportion of sedges and wetland herbs. Rushes are prominent, but they are represented by several different dominant species. The flower-rich sward includes a number of locally uncommon species, such as Marsh Lousewort and Brookweed. In terms of the NVC this is probably best classified as M23 *Juncus effusus/ acutiflorus* – *Galium palustre* mire. The base enrichment of the washery soils also adds elements of M22 *Juncus subnodulosus* – *Cirsium palustre* fen-meadow, although there was no sign of any Blunt-flowered Rush during the survey. Much of the vegetation appears to form transitions between the two communities, and also with swamp vegetation in wetter areas.

Flower-rich marshy grassland north of the washery, with prominent Greater Tussock-sedges and Ragged Robin (near Q108).

Marsh Lousewort and Brookweed in flower-rich marshy grassland north of the washery (Q119).

Flush vegetation

There are several areas of flush vegetation on gently sloping ground at the lower edges of the site, particularly at the south and west margins. In most cases the flushes are very small and the vegetation is not very different from other rush-dominated marshy grassland. The plant community probably conforms most closely to the NVC category M23 *Juncus effusus/ acutiflorus* – *Galium palustre* mire. However, the flushes tend to be relatively diverse examples of this. An area of seepage from coal spoil at the washery (Q114) appears to fit more closely with sand dune slack vegetation but this is probably just an anomaly of the unusual man-made nature of the habitat. Several locally uncommon species were found in association with flushes, including Ivy-leaved Bellflower, Whorled Caraway and Bog Pimpernel (although no quadrats included the Ivy-leaved Bellflower).

Heavily trampled flush
vegetation, with Whorled
Caraway (Q121)

Swamp vegetation

Dense stands of tall emergent plants forming swamp vegetation tend to be very localised within the site, and they are mostly low diversity plant communities. Greater Tussock-sedge forms one rather uniform stand beside a small stream, and this has been sampled in Quadrat 15. Tall sedges, Common Reed and Reed Canary-grass are patchily dominant in parts of the wet grassland north of the washery, and a stand of Lesser Pond-sedge has been sampled to represent this (Q105). Bulrush was also present as small stands in several ponds (this was not sampled because it generally exists in deeper water as single-species stands). There is also a small Common Reed reedbed near the centre of the site. NVC classification for these very low-diversity swamp communities in this case is straightforward; the Greater Tussock-sedge swamp is S3 *Carex paniculata* swamp, the Lesser Pond-sedge stand is S7 *Carex acutiformis* swamp, the Bulrush stands are S12 *Typha latifolia* swamp, and the reedbed is S4 *Phragmites australis* swamp.

Common Reed was generally present as a single-species stand in the reedbed, but a list of associated species was obtained from the whole reed bed as a target Note (TN7).

Small reed-bed between coal spoil tips (TN7)

Greater Tussock-sedge swamp
(Q15)

Lesser Pond-sedge swamp (Q105) with Alder scrub and sparse Common Reed.

Bulrush swamp vegetation in a pond at the washery (TN22).

Ponds

The study area supports a high density of ponds; many of these are relatively recent in origin, created for silt control, attenuating high flows and providing water for the mine operations. Some ponds are still very functional, with steep sides and little vegetation, but others are less intensively maintained and support a fringe of wetland plants. These typically include Common Spike-rush, Soft Rush, Sharp-flowered Rush, Bulbous Rush, Lesser Spearwort and *Sphagnum* mosses. Some of the older ponds have a well-developed submerged plant community. The acidic, silty water from the coal spoil that feeds the ponds allows species typically associated with upland pools to grow, such as Bog Pondweed, Cotton-grasses, Star-sedge and the locally rare Floating Bur-reed.

It is difficult to place the pond communities in terms of the NVC as any more than a rough approximation, particularly as each pond had a slightly different character, and elements of several different communities might be present in any pond. The fringing vegetation often has strong elements of M23 *Juncus effusus/ acutiflorus* – *Galium palustre* mire, which is

similar to much of the nearby marshy grassland. Ponds fringed by Common Spike Rush could be considered to support a narrow band of S19 *Eleocharis palustris* swamp. The boggier margins of some ponds have some similarities with M29 *Hypericum elodes* – *Potamogeton polygonifolius* soakway vegetation (although there was no sign of Marsh St.John's-wort), M6 *Carex echinata* – *Sphagnum denticulatum* mire, and the OV35 *Lythrum portula* – *Ranunculus flammula* community. The aquatic plants could feasibly be described as a species-poor version of the A24 *Juncus bulbosus* community.

Pond at TN10 showing several different plant communities. A wide belt of emergent Common Spike-rush (S19) grades to a zone of abundant Lesser Spearwort and Water Purslane (OV35) at the water's edge, and then into rush-dominated vegetation (M23) further up the bank.

Stoneworts, such as this *Nitella* species were present in a pond (TN10).

Ditches

There are numerous shallow ditches within the study area, but many of them appear to be almost dry most of the time and only support a species-poor rush-dominated flora. A few of the deeper, wetter ditches have a greater proportion of wetland plants, such as Bulrush, Angelica, Water Mint and Common Spike Rush, and the flora resembles that of the pond margins. In most cases the ditches support variations of the NVC community M23 *Juncus effusus/ acutiflorus* – *Galium palustre* mire. Some ditches support a high proportion of Bulrush or Common Spike-rush and are closer to S12 *Typha latifolia* swamp and S19 *Eleocharis palustris* swamp respectively. Some ditches which are subject to disturbance or regular management, such as around the washery, support open vegetation communities resembling the OV28 *Agrostis stolonifera* – *Ranunculus repens* community.

The ditches with greatest botanical conservation significance tend to be those that are permanently wet. Some these support a high proportion of mosses (e.g. Q42, described under *Sphagnum*-rich bog vegetation). Some have a very high proportion of sedges and flowering herbs (e.g. TN20, which has a diverse flora including Common Sedge, Star Sedge, Remote Sedge, Common Yellow Sedge and White Sedge).

The wide, shallow ditch at TN20, dominated by Common Spike-rush and Water Horsetail, but with a high diversity of flowering herbs and sedges.

A wet ditch beside a retaining wall at the washery supports a sparse wetland flora dominated by Creeping Buttercup and Creeping Bent (TN18).

Montbretia (near TN18), an invasive species seen at the washery.

Stream

The largest stream within the study area is the Afon Dulais which flows past the southern boundary. It flows just outside the Celtic Energy land ownership boundary so could only be examined from beside the adjacent fence (TN11). The stream is approximately 2-3m wide and flows in a meandering channel. The stream bed is stony and has localised ochre deposits. The channel is bordered by marshy grassland and flush vegetation, which is lightly grazed by sheep. Much of it appears to conform to the NVC category M23 *Juncus effusus/ acutiflorus* – *Galium palustre* mire, but it locally grades into tall, dense stands of Meadowsweet which are classified as M27 *Filipendula ulmaria* – *Angelica sylvestris* mire.

Afon Dulais stream at TN11, fringed by marshy grassland and Meadowsweet mire.

Table 25. Species-list for Afon Dulais stream at TN11

<i>Alnus glutinosa</i>	<i>Lotus pedunculatus</i>

<i>Juncus bulbosus</i>	<i>Valeriana officinalis</i>
<i>Juncus effusus</i>	<i>Wahlenbergia hederacea</i>
<i>Juncus inflexus</i>	

Damp, shaded cliffs

Several shaded streams within woodland near the study area margins include steep rock outcrops and small waterfalls, creating a humid, moss-covered habitat with abundant ferns. Two of these were investigated during the survey. TN3 is a stream-side cliff, and TN2 a waterfall. Both were too steep and slippery to search fully, but provisional species lists were compiled of the most abundant species.

The damp cliff habitat does not easily fit within the NVC, but it is probably best to describe it as local variations within the W11 *Quercus petraea* – *Betula pubescens* – *Oxalis acetosella* woodland and W9 *Fraxinus excelsior* – *Sorbus aucuparia* – *Mercurialis perennis* woodland that surround these streams. The local high abundance of bryophytes and ferns has affinity with the W17a *Quercus petraea* – *Betula pubescens* – *Dicranum majus* woodland *Isoetes myosuroides* – *Diplophyllum albicans* sub-community, but it is not a good match in the absence of several other species that should be constant in that habitat.

Streamside cliff at TN3

Table 26. Species-list for damp, shaded cliff habitats

<i>Viola riviniana</i>		X	III

Waterfall at TN2

Vegetation on old stone walls

Several examples of vegetation growing on old stone walls were seen. The largest is a former railway retaining wall in west of the study area. This heavily shaded wall was visible from the cycleway and appears to be largely covered in ferns and Ivy. However, it lies outside the Celtic Energy land ownership boundary so could not be examined closely. Vegetation was also seen on old brickwork on retaining walls at the washery, and the Onllwyn railway bridge, but only in very small quantity. The one example of vegetation on old stone walls that was collected as a target note was from a former mine structure in the south-west of the study area (TN1). In terms of the NVC the closest communities are possibly OV39 *Asplenium trichomanes* – *A.ruta-muraria* community, or W21 *Crataegus monogyna* – *Hedera helix* scrub, but it is not a good match for either. Other examples of vegetated stonework may be present at structures outside the Celtic Energy landholding that could not be accessed during the current survey. For example, there is a disused mine shown on the Ordnance Survey map in land at the far west of the study area.

Table 27. Species-list for vegetated old stonework at TN1

<i>Asplenium adiantum-nigrum</i>	<i>Geranium robertianum</i>
<i>Asplenium scolopendrium</i>	<i>Hedera helix</i> sl
<i>Asplenium trichomanes</i>	<i>Pseudoscleropodium purum</i>
<i>Epilobium brunnescens</i>	<i>Rosa canina</i>
<i>Epilobium montanum</i>	<i>Rubus fruticosus</i>
<i>Festuca rubra</i>	<i>Sedum acre</i>
<i>Fragaria vesca</i>	<i>Sorbus aucuparia</i>
<i>Geranium dissectum</i>	<i>Urtica dioica</i>

Vegetation on old stone walls at a disused mining structure (TN1)

4. Evaluation

This section evaluates the nature conservation significance of the plant communities in a geographical context, based on the approach set out in 'Guidelines for Ecological Impact Assessment' (CIEEM, 2018). The criteria used to assist in the evaluation are summarised in Table 28.

Table 28: Evaluation criteria

Level of Value	Habitats
International	Areas designated as Special Areas of Conservation (SAC), Special Protection Areas (SPA) or Ramsar sites in response to European Directives and International Conventions.
National	Areas designated as Sites of Special Scientific Interest (SSSI), National Nature Reserve (NNR), or equivalent for key areas, habitats and plant communities.
Regional	Areas of habitat of suitable size and quality to be considered for notification as SSSI (based on Guidelines for the Selection of Biological SSSIs, JNCC 1998). Extensive areas of Environment (Wales) Act (2016) Section 7 habitats, listed as 'habitats of principal importance for the purpose of maintaining and enhancing biodiversity in relation to Wales.
County	Areas meeting Wildlife Sites Guidelines selection criteria; areas of Section 7 habitats; areas of Ancient woodland.
District/Local value	Areas of LBAP habitat. Important hedgerows classified under The Hedgerow Regulations 1997. Any non-designated habitat assemblage of moderate biodiversity value.

The study confirmed that there is a wide variety of vegetation types within the study area. A high proportion of the site comprises recently restored, heavily grazed semi-improved pasture and this is very species-poor with negligible botanical interest.

There are no habitats or plant communities that are considered important in a national context. In this case the habitats of greatest value for nature conservation are included within the Welsh Government's Environment (Wales) Act list of Section 7 habitats. The examples of Section 7 habitats present at this site are relatively small or species poor examples of the habitats. This is because the majority of the study area has been heavily affected by human activity, either through mine-working or intensive sheep-grazing, and this has affected the size and quality of the habitats. Consequently the highest value that should be considered from the criteria above is county context rather than regional context in this case.

Several of the plant communities would be deemed to be of county importance on the basis of the Wildlife Sites Guidelines. Each is evaluated in Table 29 below, in the same order that they have been presented in the report. For the purposes of this assessment the value relates only to the vegetation, and not to other wildlife such as birds, mammals or fungi (e.g. a pond might be valued as Local value for its flora, but could potentially be of county value for amphibians or breeding birds, or vice versa).

Table 29. Summary evaluation of habitats within the study area, based on vegetation

Vegetation type	Comments	Evaluation
Semi-natural broad-leaved woodland	Small examples of W11 upland oak woodland, and W9 upland mixed ash woodland present near site perimeter. These are Section 7 habitats and include small remnants of ancient woodland.	County value.
Plantation and scrub woodland	Relatively young habitats with limited botanical diversity.	Local value.
Conifer plantation	Relatively young and even-aged, with only a sparse ground flora. The large population of Common Wintergreen is of importance in a county context.	Mostly Local value, but Common Wintergreen is of County value.
Acid grassland	Patchily distributed through much of the study area and mainly represented by U1 and U4 grassland, sometimes forming mosaics with other vegetation. Most of the acid grassland is relatively species-poor and in a heavily-grazed state.	The diverse swards and mosaics with heath vegetation are of County value. Low diversity young or sparse swards are of negligible value.
Neutral grassland	Mostly limited to small patches and road-side strips, mainly MG5 and MG1 but very variable in species diversity.	Local value.
Semi-improved acid grassland	Many extensive examples, especially on well-drained slopes associated with former mining activity. Including some areas with high densities of ant-hills.	Older, diverse swards are of County value. Younger, species-poor swards are of negligible value.
Sparse grassland on coal spoil and washery sidings	Many variations on U1 grassland. There is a full spectrum of cover and diversity from almost bare spoil to very high diversity vegetation which includes locally uncommon species.	Conservation value reflects the diversity of the swards. Young, species-poor stands are of Negligible value, but well established diverse swards are of Local and County value.
Dry heath	The study area supports very few examples of heath with >25% cover by dwarf shrub species that would qualify as the S7 habitat 'upland heathland'. The largest area is in the restoration area in the centre of the site, which supports H1 heath. Heath is mostly only present as mosaic component amongst acid grassland on former colliery slopes.	County value.
Wet heath/ marshy grassland mosaic	Only a few small examples present, and mostly M25 mire, grading into other habitat mosaics. All that were seen support a good range of species.	County value.
<i>Sphagnum</i> -rich bog vegetation	Only a few small areas are present, but they all support uncommon plants and all occur in association with other diverse marshy grassland and heath.	County value.

Vegetation type	Comments	Evaluation
Marshy grassland	Several relatively large areas are present that are dominated by Purple Moor-grass (M25 mire) and rush pasture (M23 mire). The most diverse would qualify as the S7 habitat 'Purple Moor-grass and rush pastures'. An extensive area of diverse, minerotrophic M23/ M24 marshy grassland is present in wet fields with coal spoil north of the washery. A high proportion of marshy grassland on recently restored farmland is species poor MG10 rush pasture with negligible value.	The diverse M23 and M25 swards are of County value. Lower diversity MG23 swards are of no more than Local value.
Flush vegetation	Several small M23 flushes are present; mostly at the margins of the grazed upland areas. They support a diverse sward with locally uncommon plant species.	County value.
Swamp	Several areas of swamp vegetation are present, but they are mostly too small to qualify as priority habitat. Only one small area of S4 reedbed is present, but this is relatively small and species-poor.	Local value.
Ponds	There is an extensive network of ponds within the site. They are of man-made origin but support a variety of vegetation types, including several locally rare plant species such as Floating Bur-reed.	Ponds with rare plant species may be of County value. Most individual ponds are of Local value.
Ditches	There are a range of ditch types within the site. Most are small with a limited wetland flora. Several larger ones support a more diverse flora.	Most small ditches have negligible value, but some larger ones have Local value.
Stream	The Afon Dulais is the only significant stream within the study area. It has a natural channel profile with a naturally meandering course and is bordered by diverse wetland vegetation and therefore meets the wildlife sites qualifying criteria.	County value.
Damp shaded cliffs	Local features associated with woodland streams, with a diverse assemblage of ferns and bryophytes.	Local value (but some may be part of County value woodland).
Vegetated old stone walls	A small number of man-made features with sparse vegetation. The largest in the study area was not accessible.	Negligible value (but some may be part of local value woodland).

The majority of plants recorded during the study are common and widespread species. The only species found that has any special statutory protection under the Wildlife and Countryside Act is Bluebell, which was present in woodland. The protection of Bluebell only relates to sale, so is not relevant to the Project. None of the plants seen are included in the Environment (Wales) Act 2016 Section 7 lists of species of 'principal importance for the purpose of maintaining and enhancing biodiversity in relation to Wales'.

Several plants were found that are listed as being rare or in South Wales in the Wildlife Sites Guidelines (Wales Biodiversity Partnership, 2008). Under these guidelines a site is considered significant in a county context if it supports one or more Primary Species or five or more Contributory Species. In this case the rare species recorded are summarised below:

- Bee Orchid (Contributory Species). Locally abundant on sparsely vegetated coal spoil at the washery.
- Bird Cherry (Contributory Species). In plantation/ scrub on restored areas north of Nant Helen mine (probably planted).
- Brookweed (Contributory Species). Locally frequent in base-rich damp ground at the washery.
- Brown Sedge (Contributory Species). Rare on flushed ground on coal spoil at the washery.
- Common Cudweed (Primary Species). Two plants observed in disturbed ground in horse-grazed pasture south-east of the washery.
- Common Wintergreen (Primary Species). Abundant in conifer plantation at north-western boundary.
- Eyebright (*Euphrasia arctica ssp borealis*) (Contributory Species). Occasional in grassland on coal spoil/ washery sidings.
- Floating Bur-reed (Primary Species). Flowering plants confirmed in two upland ponds. Floating leaves of non-flowering plants present in several other ponds suggest that it is probably also present in those, but they could not be confirmed with certainty.
- Lesser Bulrush (Primary Species). Present along margins of water treatment pond at TN6.
- Royal Fern (Contributory Species). A single young plant noted in *Sphagnum*-rich mire near Quadrat 48.
- Small Cudweed (Contributory Species). Locally abundant on sparsely vegetated spoil.
- Spiked Water-milfoil (Contributory Species). Present in ponds at TN4.
- Viviparous Fescue (Primary Species). Several plants noted in sparsely vegetated coal spoil near pond at TN6.

Viviparous Fescue, a 'Primary Species' recorded at TN6.

It is likely that further investigations within the study area would confirm the presence of many more plant species, and that some of these would include additional locally scarce species.

Common Cudweed, a 'Primary Species' recorded in horse-grazed pasture east of the washery (at Quadrat 126). This species might also occur at low density on coal spoil in other parts of the site.

Lesser Bulrush, a 'Primary Species' present beside water treatment pond (at TN6).

A flowering head of Floating Bur-reed; a 'Primary Species' that was confirmed in ponds at TN5 and 10. Floating leaves likely to be this species were also seen in several other ponds but could not be confirmed in the absence of flowering heads.

Two other plants listed in the Wildlife Sites Guidelines were recorded at the washery (by the same surveyor) in 2015, namely Grass Vetchling (Contributory Species) in species-rich neutral grassland, and Fen Bedstraw (Primary Species) in marshy grassland to the north. Although neither were seen during the present study there is a reasonable probability that they may still be present but were not seen during the present survey because the plants only occur at a low density and the whole area could not be searched thoroughly.

In addition to plants noted for their rarity, several species were found that are significant because of their listing on Schedule 9 of the Wildlife and Countryside Act as non-native invasive species. They include the following:

- Japanese Knotweed. Small patches at the washery, and by northern cycleway.
- Montbretia. Several clumps near the washery buildings.
- Hollyberry Cotoneaster. Scattered plants in plantation / scrub and washery coal spoil.
- Himalayan Cotoneaster. Scattered plants on washery coal spoil.
- Wall Cotoneaster. Scattered plants on washery coal spoil.
- Entire-leaved Cotoneaster. Scattered plants on washery coal spoil.

Japanese Knotweed at the washery, near Quadrat 99

Himalayan Cotoneaster on coal spoil at the washery (near Q125).

Appendix 1. Plant species list

The following species list presents the scientific and common names of all the plant species identified during the vegetation surveys. Due to the size of the site, restrictions on access to some parts, and nature of the sampling, this should not be considered a comprehensive list of every plant species within the study area.

Species	Common name
VASCULAR PLANTS	
<i>Acer campestre</i>	Field Maple
<i>Acer pseudoplatanus</i>	Sycamore
<i>Achillea millefolium</i>	Yarrow
<i>Achillea ptarmica</i>	Sneezewort
<i>Agrostis canina</i>	Velvet Bent
<i>Agrostis capillaris</i>	Common Bent
<i>Agrostis stolonifera</i>	Creeping Bent
<i>Aira caryophyllaea</i>	Silver Hair-grass
<i>Aira praecox</i>	Early Hair-grass
<i>Alchemilla sp.</i>	Lady's Mantle
<i>Alnus cordata</i>	Italian Alder
<i>Alnus glutinosa</i>	Alder
<i>Alnus incana</i>	Grey Alder
<i>Alopecurus geniculatus</i>	Marsh Foxtail
<i>Alopecurus pratensis</i>	Meadow Foxtail
<i>Anagallis tenella</i>	Bog Pimpernel
<i>Anaphalis margaritacea</i>	Pearly Everlasting
<i>Angelica sylvestris</i>	Angelica
<i>Anthoxanthum odoratum</i>	Sweet Vernal-grass
<i>Anthyllis vulneraria</i>	Kidney-vetch
<i>Arenaria serpyllifolia</i>	Thyme-leaved Sandwort
<i>Arrhenatherum elatius</i>	False Oat-grass
<i>Asplenium adiantum-nigrum</i>	Black Spleenwort
<i>Asplenium scolopendrium</i>	Hart's-tongue Fern
<i>Asplenium trichomanes</i>	Maidenhair Spleenwort
<i>Athyrium filix-femina</i>	Lady Fern
<i>Bellis perennis</i>	Daisy
<i>Betula pendula</i>	Silver Birch
<i>Betula pubescens</i>	Downy Birch
<i>Blechnum spicant</i>	Hard Fern
<i>Brachypodium sylvaticum</i>	False Brome
<i>Briza media</i>	Quaking Grass
<i>Bromus hordeaceus</i>	Soft Brome
<i>Buddleja davidii</i>	Butterfly Bush
<i>Callitriche sp.</i>	Water Starwort
<i>Calluna vulgaris</i>	Heather
<i>Caltha palustris</i>	Marsh Marigold

Species	Common name
<i>Cardamine cf flexuosa</i>	Wavy Bittercress
<i>Cardamine pratensis</i>	Cuckoo Flower
<i>Carex acutiformis</i>	Lesser Pond-sedge
<i>Carex binervis</i>	Green-ribbed Sedge
<i>Carex curta</i>	White Sedge
<i>Carex demissa</i>	Common Yellow-Sedge
<i>Carex disticha</i>	Brown Sedge
<i>Carex echinata</i>	Star Sedge
<i>Carex flacca</i>	Glaucous Sedge
<i>Carex hirta</i>	Hairy Sedge
<i>Carex hostiana</i>	Tawny Sedge
<i>Carex leporina</i>	Oval Sedge
<i>Carex nigra</i>	Common Sedge
<i>Carex otrubae</i>	False Fox-sedge
<i>Carex pallescens</i>	Pale Sedge
<i>Carex panicea</i>	Carnation Sedge
<i>Carex paniculata</i>	Greater Tussock-sedge
<i>Carex pendula</i>	Pendulous Sedge
<i>Carex pilulifera</i>	Pill Sedge
<i>Carex pulicaris</i>	Flea Sedge
<i>Carex remota</i>	Remote Sedge
<i>Carex rostrata</i>	Bottle Sedge
<i>Carex spicata</i>	Spiked Sedge
<i>Carex sylvatica</i>	Wood Sedge
<i>Carlina vulgaris</i>	Carlina Thistle
<i>Castanea sativa</i>	Sweet Chestnut (Planted)
<i>Centaurea nigra</i>	Common Knapweed
<i>Centaureum erythraea</i>	Common Centaury
<i>Cerastium fontanum</i>	Common Mouse-ear
<i>Chamerion angustifolium</i>	Rose-Bay Willowherb
<i>Chrysosplenium oppositifolium</i>	Opposite-leaved Golden-saxifrage
<i>Circaea lutetiana</i>	Enchanter's Nightshade
<i>Cirsium arvense</i>	Creeping Thistle
<i>Cirsium palustre</i>	Marsh Thistle
<i>Cirsium vulgare</i>	Spear Thistle
<i>Cornus sanguinea</i>	Dogwood
<i>Cornus sericea</i>	Red-osier Dogwood
<i>Corylus avellana</i>	Hazel
<i>Cotoneaster bullatus</i>	Hollyberry Cotoneaster
<i>Cotoneaster integrifolius</i>	Entire-leaved Cotoneaster
<i>Cotoneaster simonsii</i>	Himalayan Cotoneaster
<i>Crataegus monogyna</i>	Hawthorn
<i>Crepis capillaris</i>	Smooth Hawk's-beard
<i>Crocsmia crocosmiiflora</i>	Montbretia
<i>Cynosurus cristatus</i>	Crested Dog's-tail
<i>Cytisus scoparius</i>	Broom

Species	Common name
<i>Dactylis glomerata</i>	Cock's-foot Grass
<i>Dactylorhiza fuchsii</i>	Common Spotted-orchid
<i>Dactylorhiza maculata</i>	Heath Spotted-orchid
<i>Dactylorhiza praetermissa</i>	Southern Marsh-orchid
<i>Dactylorhiza sp.</i>	Hybrid Marsh-orchid
<i>Danthonia decumbens</i>	Heath Grass
<i>Daucus carota</i>	Wild Carrot
<i>Deschampsia cespitosa</i>	Tufted Hair-grass
<i>Deschampsia flexuosa</i>	Wavy Hair-grass
<i>Digitalis purpurea</i>	Foxglove
<i>Dipsacus fullonum</i>	Teasel
<i>Drosera rotundifolia</i>	Round-leaved Sundew
<i>Dryopteris affinis</i>	Scaly Male-fern
<i>Dryopteris carthusiana</i>	Narrow Buckler-fern
<i>Dryopteris dilatata</i>	Broad Buckler-fern
<i>Dryopteris filix-mas</i>	Male Fern
<i>Eleocharis palustris</i>	Common Spike-rush
<i>Elytrigia repens</i>	Couch
<i>Epilobium brunnescens</i>	New Zealand Willowherb
<i>Epilobium ciliatum</i>	American Willowherb
<i>Epilobium hirsutum</i>	Greater Willowherb
<i>Epilobium montanum</i>	Broad-leaved Willowherb
<i>Epilobium palustre</i>	Marsh Willowherb
<i>Epilobium parviflorum</i>	Hoary Willowherb
<i>Epilobium tetragonum</i>	Square-stalked Willowherb
<i>Epipactis helleborine</i>	Broad-leaved Helleborine
<i>Equisetum arvense</i>	Field Horsetail
<i>Equisetum fluviatile</i>	Water Horsetail
<i>Equisetum palustre</i>	Marsh Horsetail
<i>Equisetum sp.</i>	Horsetail (indeterminate)
<i>Erica tetralix</i>	Cross-leaved Heath
<i>Erigeron acris</i>	Blue Fleabane
<i>Eriophorum angustifolium</i>	Common Cotton-grass
<i>Eriophorum vaginatum</i>	Hare's-tail Cotton-grass
<i>Eupatorium cannabinum</i>	Hemp Agrimony
<i>Euphrasia cf arctica ssp borealis</i>	Eyebright
<i>Euphrasia cf nemorosa</i>	Eyebright
<i>Euphrasia sp.</i>	Eyebright
<i>Fagus sylvatica</i>	Beech (planted)
<i>Festuca gigantea</i>	Giant Fescue
<i>Festuca ovina</i>	Sheep's Fescue
<i>Festuca rubra</i>	Red Fescue
<i>Festuca vivipara</i>	Viviparous Sheep's-fescue
<i>Filago germanica</i>	Common Cudweed
<i>Filago minima</i>	Small Cudweed
<i>Filipendula ulmaria</i>	Meadowsweet

Species	Common name
<i>Fragaria vesca</i>	Wild Strawberry
<i>Fraxinus excelsior</i>	Ash
<i>Galeopsis cf tetrahit</i>	Common Hemp-nettle
<i>Galium aparine</i>	Cleavers
<i>Galium palustre</i>	Marsh Bedstraw
<i>Galium saxatile</i>	Heath Bedstraw
<i>Geranium dissectum</i>	Cut-leaved Crane's-bill
<i>Geranium molle</i>	Dove's-foot Crane's-bill
<i>Geranium robertianum</i>	Herb Robert
<i>Geum urbanum</i>	Wood Avens
<i>Glyceria fluitans</i>	Floating Sweet-grass
<i>Hedera helix sl</i>	Ivy
<i>Heracleum sphondylium</i>	Hogweed
<i>Hieracium sp.</i>	Hawkweed (indeterminate)
<i>Hirschfeldia incana</i>	Hoary Mustard
<i>Holcus lanatus</i>	Yorkshire Fog
<i>Holcus mollis</i>	Creeping Soft-grass
<i>Hyacinthoides non-scripta</i>	Bluebell
<i>Hydrocotyle vulgaris</i>	Marsh Pennywort
<i>Hypericum androsaemum</i>	Tutsan
<i>Hypericum maculatum</i>	Imperforate St. John's-wort
<i>Hypericum perforatum</i>	Perforate St. John's-wort
<i>Hypericum pulchrum</i>	Slender St. John's-wort
<i>Hypericum tetrapterum</i>	Square-stalked St. John's-wort
<i>Hypochaeris radicata</i>	Common Cat's-Ear
<i>Ilex aquifolium</i>	Holly
<i>Iris pseudacorus</i>	Yellow Flag Iris
<i>Isolepis setacea</i>	Bristle Club-rush
<i>Juncus acutiflorus</i>	Sharp-flowered Rush
<i>Juncus articulatus</i>	Jointed Rush
<i>Juncus bufonius</i>	Toad Rush
<i>Juncus bulbosus</i>	Bulbous Rush
<i>Juncus conglomeratus</i>	Compact Rush
<i>Juncus effusus</i>	Soft Rush
<i>Juncus inflexus</i>	Hard Rush
<i>Juncus squarrosus</i>	Heath Rush
<i>Juncus tenuis</i>	Slender Rush
<i>Larix sp.</i>	Larch
<i>Lathyrus pratensis</i>	Meadow Vetchling
<i>Lemna minor</i>	Common Duckweed
<i>Leontodon hispidus</i>	Rough hawk-bit
<i>Leontodon saxatilis</i>	Lesser Hawk-bit
<i>Leucanthemum vulgare</i>	Ox-eye Daisy
<i>Linum catharticum</i>	Fairy Flax
<i>Lolium perenne</i>	Perennial Rye-grass
<i>Lotus corniculatus</i>	Common Bird's-foot Trefoil

Species	Common name
<i>Lotus pedunculatus</i>	Greater Bird's-foot Trefoil
<i>Luzula campestris</i>	Field Woodrush
<i>Luzula multiflora</i>	Heath Woodrush
<i>Luzula pilosa</i>	Hairy Woodrush
<i>Lycopus europaeus</i>	Gypsywort
<i>Lysimachia nemorum</i>	Yellow Pimpernel
<i>Lysimachia nummularia</i>	Creeping Jenny
<i>Lythrum portula</i>	Water Purslane
<i>Lythrum salicaria</i>	Purple Loosestrife
<i>Malus pumila</i>	Apple
<i>Medicago lupulina</i>	Black Medick
<i>Melilotus cf officinalis</i>	Ribbed Melilot
<i>Mentha aquatica</i>	Water Mint
<i>Molinia caerulea</i>	Purple Moor-grass
<i>Montia fontana</i>	Blinks
<i>Myosotis laxa</i>	Tufted Forget-me-not
<i>Myosotis scorpioides</i>	Water Forget-me-not
<i>Myosotis secunda</i>	Creeping Forget-me-not
<i>Myriophyllum spicatum</i>	Spiked Water-milfoil
<i>Narcissus sp.</i>	Daffodil (garden variety)
<i>Nardus stricta</i>	Mat-grass
<i>Nothofagus nervosa</i>	Rauli
<i>Odontites vernus</i>	Red Bartsia
<i>Oenothera sp.</i>	Evening Primrose (indeterminate)
<i>Onobrychis viciifolia</i>	Common Sainfoin
<i>Ononis repens</i>	Restharrow
<i>Ophrys apifera</i>	Bee Orchid
<i>Oreopteris limbosperma</i>	Lemon-scented Fern
<i>Osmunda regalis</i>	Royal Fern
<i>Oxalis acetosella</i>	Wood Sorrel
<i>Pastinaca sativa</i>	Wild Parsnip
<i>Pedicularis palustris</i>	Marsh Lousewort
<i>Pedicularis sylvatica</i>	Common Lousewort
<i>Persicaria hydropiper</i>	Water-pepper
<i>Persicaria maculosa</i>	Redshank
<i>Philonotis fontana</i>	Fountain Apple-moss
<i>Phleum pratense</i>	Timothy
<i>Phragmites australis</i>	Common Reed
<i>Picea sitchensis</i>	Sitka Spruce
<i>Pilosella aurantiaca</i>	Fox-and-cubs
<i>Pilosella officinarum</i>	Mouse-ear Hawkweed
<i>Pinus cf nigra</i>	Austrian Pine
<i>Pinus contorta</i>	Lodgepole Pine
<i>Plantago lanceolata</i>	Ribwort Plantain
<i>Plantago major</i>	Greater Plantain
<i>Poa annua</i>	Annual Meadow-grass

Species	Common name
<i>Poa compressa</i>	Flattened Meadow-grass
<i>Poa palustris</i>	Swamp Meadow-grass
<i>Poa pratensis</i>	Smooth Meadow-grass
<i>Poa trivialis</i>	Rough Meadow-grass
<i>Polygala serpyllifolia</i>	Heath Milkwort
<i>Polygonatum sp.</i>	Solomon's Seal (planted)
<i>Polypodium vulgare</i>	Common Polypody
<i>Polystichum setiferum</i>	Soft Shield-fern
<i>Potamogeton natans</i>	Broad-leaved Pondweed
<i>Potamogeton polygonifolius</i>	Bog Pondweed
<i>Potentilla anglica</i>	Trailing Tormentil
<i>Potentilla anserina</i>	Silverweed
<i>Potentilla erecta</i>	Tormentil
<i>Potentilla palustris</i>	Marsh Cinquefoil
<i>Potentilla reptans</i>	Creeping Cinquefoil
<i>Potentilla sterilis</i>	Barren Strawberry
<i>Primula veris</i>	Cowslip
<i>Prunella vulgaris</i>	Self-Heal
<i>Prunus avium</i>	Wild Cherry
<i>Prunus padus</i>	Bird Cherry
<i>Prunus spinosa</i>	Blackthorn
<i>Pulicaria dysenterica</i>	Fleabane
<i>Pyrola minor</i>	Common Wintergreen
<i>Quercus petraea</i>	Sessile Oak
<i>Quercus robur</i>	Pedunculate Oak
<i>Quercus x rosacea</i>	Hybrid Oak
<i>Ranunculus acris</i>	Meadow Buttercup
<i>Ranunculus flammula</i>	Lesser Spearwort
<i>Ranunculus omiophyllus</i>	Round-leaved Water-crowfoot
<i>Ranunculus repens</i>	Creeping Buttercup
<i>Reynoutria japonica</i>	Japanese Knotweed
<i>Rhinanthus minor</i>	Yellow Rattle
<i>Rhododendron ponticum</i>	Rhododendron
<i>Ribes nigrum</i>	Black Currant
<i>Rosa arvensis</i>	Field Rose
<i>Rosa canina</i>	Dog Rose
<i>Rosa rugosa</i>	Japanese Rose
<i>Rosa sherardii</i>	Sherard's Downy-rose
<i>Rubus fruticosus</i>	Bramble
<i>Rumex acetosa</i>	Common Sorrel
<i>Rumex acetosella</i>	Sheep's Sorrel
<i>Rumex conglomeratus</i>	Clustered Dock
<i>Rumex crispus</i>	Curled Dock
<i>Rumex obtusifolius</i>	Broad-Leaved Dock
<i>Rumex sanguineus</i>	Wood Dock
<i>Sagina filicaulis</i>	Slender Pearlwort

Species	Common name
<i>Sagina procumbens</i>	Procumbent Pearlwort
<i>Salix alba</i>	White Willow
<i>Salix aurita</i>	Eared Willow
<i>Salix caprea</i>	Goat Willow
<i>Salix cinerea</i>	Grey Willow
<i>Salix repens</i>	Creeping Willow
<i>Salix viminalis</i>	Osier
<i>Sambucus nigra</i>	Elder
<i>Samolus valerandi</i>	Brookweed
<i>Sanicula europaea</i>	Sanicle
<i>Scorzonoides autumnalis</i>	Autumn Hawk-bit
<i>Scrophularia auriculata</i>	Water Figwort
<i>Scrophularia nodosa</i>	Common Figwort
<i>Scutellaria galericulata</i>	Common Skullcap
<i>Scutellaria minor</i>	Lesser Skullcap
<i>Sedum acre</i>	Wall Pepper
<i>Senecio aquaticus</i>	Marsh Ragwort
<i>Senecio jacobaea</i>	Ragwort
<i>Silene flos-cuculi</i>	Ragged Robin
<i>Solanum dulcamara</i>	Bittersweet
<i>Solidago virgaurea</i>	Goldenrod
<i>Sonchus oleraceus</i>	Smooth Sow-thistle
<i>Sorbus aucuparia</i>	Rowan
<i>Sorbus intermedia</i>	Swedish Whitebeam (planted)
<i>Sparganium angustifolium</i>	Floating Bur-reed
<i>Stachys palustris</i>	Marsh Woundwort
<i>Stachys sylvatica</i>	Hedge Woundwort
<i>Stellaria alsine</i>	Bog Stitchwort
<i>Stellaria graminea</i>	Lesser Stitchwort
<i>Stellaria media</i>	Chickweed
<i>Succisa pratensis</i>	Devil's-bit Scabious
<i>Taraxacum</i> sp.	Dandelion
<i>Tilia cordata</i>	Small-leaved Lime (planted)
<i>Torilis japonica</i>	Upright Hedge-parsley
<i>Tragopogon pratensis</i>	Goat's-beard
<i>Trichophorum cespitosum</i>	Deer-grass
<i>Trifolium dubium</i>	Lesser Trefoil
<i>Trifolium pratense</i>	Red Clover
<i>Trifolium repens</i>	White Clover
<i>Trocdaris verticillatum</i>	Whorled Caraway
<i>Tussilago farfara</i>	Colt's Foot
<i>Typha angustifolia</i>	Lesser Bulrush
<i>Typha latifolia</i>	Bulrush
<i>Ulex europaeus</i>	Common Gorse
<i>Urtica dioica</i>	Nettle
<i>Vaccinium myrtillus</i>	Bilberry

Species	Common name
<i>Valeriana dioica</i>	Marsh Valerian
<i>Valeriana officinalis</i>	Common Valerian
<i>Verbascum thapsus</i>	Greater Mullein
<i>Veronica arvensis</i>	Wall Speedwell
<i>Veronica beccabunga</i>	Brooklime
<i>Veronica chamaedrys</i>	Germander Speedwell
<i>Veronica montana</i>	Wood Speedwell
<i>Veronica officinalis</i>	Heath Speedwell
<i>Veronica scutellata</i>	Marsh Speedwell
<i>Veronica serpyllifolia</i>	Thyme-leaved Speedwell
<i>Viburnum opulus</i>	Guelder Rose
<i>Vicia cracca</i>	Tufted Vetch
<i>Vicia hirsuta</i>	Hairy Tare
<i>Vicia sativa</i>	Common Vetch
<i>Vicia sepium</i>	Bush Vetch
<i>Viola palustris</i>	Marsh Violet
<i>Viola riviniana</i>	Common Dog-violet
<i>Vulpia bromoides</i>	Squirrel-tail Fescue
<i>Wahlenbergia hederacea</i>	Ivy-leaved Bellflower
BRYOPHYTES	
<i>Aneura pinguis</i>	Greasewort
<i>Atrichum undulatum</i>	Common Smoothcap
<i>Aulacomnium palustre</i>	Bog Groove-moss
<i>Brachythecium rivulare</i>	River Feather-moss
<i>Brachythecium rutabulum</i>	Rough-stalked Feather-moss
<i>Bryum alpinum</i>	Alpine Thread-moss
<i>Bryum pseudotriquetrum</i>	Marsh Bryum
<i>Calliergon cordifolium</i>	Heart-leaved Spear-moss
<i>Calliergonella cuspidata</i>	Pointed Spear-moss
<i>Campyliadelphus chrysophyllus</i>	Golden Feather-moss
<i>Campylopus introflexus</i>	Heath Star-moss
<i>Ceratodon purpureus</i>	Redshank
<i>Chiloscyphus polyanthos</i>	St Winifred's Moss
<i>Climacium dendroides</i>	Tree Moss
<i>Conocephalum conicum</i>	Great Scented Liverwort
<i>Cratoneuron filicinum</i>	Fern-leaved Hook-moss
<i>Ctenidium molluscum</i>	Chalk Comb-moss
<i>Dichodontium palustre</i>	Marsh Forklet-moss
<i>Dicranum majus</i>	Greater Fork-moss
<i>Dicranum scoparium</i>	Broom Fork-moss
<i>Didymodon insulanus</i>	Cylindric Beard-moss
<i>Diplophyllum albicans</i>	White Earwort
<i>Encalypta streptocarpa</i>	Spiral Extinguisher-moss
<i>Eurhynchium striatum</i>	Common Striated feather-moss
<i>Fissidens adianthoides</i>	Maidenhair Pocket-moss
<i>Fissidens bryoides</i>	Lesser Pocket-moss

Species	Common name
<i>Fissidens taxifolius</i>	Common Pocket-moss
<i>Funaria hygrometrica</i>	Common Cord-moss
<i>Homalothecium lutescens</i>	Yellow Feather-moss
<i>Homalothecium sericeum</i>	Silky Wall Feather-moss
<i>Hookeria lucens</i>	Shining Hookeria
<i>Hylocomium splendens</i>	Glittering Feather-moss
<i>Hypnum cupressiforme</i>	Cypress-leaved Plait-moss
<i>Hypnum jutlandicum</i>	Heath Plait-moss
<i>Hypnum lacunosum</i>	Great Plait-moss
<i>Isothecium myosuroides</i>	Mouse-tail Moss
<i>Kindbergia praelonga</i>	Common Feather-moss

1. Introduction

Ove Arup and Partners Ltd ('Arup') are currently undertaking surveys for the proposed Nant Helen Complementary Restoration Earthworks (hereafter referred to as the 'Project'), located on the Nant Helen opencast mine and Onllwyn washery, between Seven Sisters and Abercraf (approximate grid reference SN826110). The survey is required to support the design and assessment process for the Project. Several waxcap fungi were observed during ecology surveys carried out during June and July 2019, which indicated that the habitats within the Study Area had potential to support significant populations of grassland fungi. Arup subsequently commissioned Sturgess Ecology to investigate this further by carrying out a survey of some of the most likely areas during the autumn.

Waxcap and Pink-gill fungi seen in acid grassland at Onllwyn washery during botanical surveys in June 2019.

2. Survey method

The field work was carried out by Dr Peter Sturgess CEnv MCIEEM, an ecologist experienced in grassland fungi surveys, and familiar with the types of habitats and terrain that occur on the site.

There are currently no standard survey protocols for grassland fungi, and recording is mostly carried out using walk-over methods. In this case, because the area is so large, and fungi fruit over many months, the survey was limited to a sampling-based approach, focusing on a set of 12 areas considered to have high potential for grassland fungi, and sampling these on 2 occasions spread out through the main autumn fruiting period. Each survey was carried out over 2 days due to the large area to be walked over.

The survey dates were as follows:

- Visit 1: 26 & 27 September 2019.
- Visit 2: 10 & 14 October 2019.
- Visit 3: 5 & 6 November 2019.

The visits all coincided with good conditions for fungi fruiting (i.e. damp conditions with no heavy frosts).

The survey areas are shown in Figure 1. Each visit involved walking through the 12 survey areas, focussing on the patches of vegetation considered to have the highest potential value for grassland fungi; particularly short grassland with no evidence of agricultural improvement by ploughing or use of fertilisers. Patches of scrub, woodland, marshy grassland, recently disturbed ground and other longer grassland were mostly avoided as they have low potential value for grassland fungi. The coverage of each survey area typically took between 1 and 2 hours, depending on the size and complexity.

In a patchy habitat like this (in Area 12) the grassland fungi tended to be limited to the shorter grass. The rush patches and areas of marshy grassland were avoided.

The survey was restricted to three target groups that are generally recognised as being good indicators of nature conservation value for grassland fungi; namely waxcap fungi (*Hygrocybe* spp.), earth tongues (Geoglossaceae) and fairy clubs (Clavariaceae). Pinkgill fungi (*Entoloma* spp.) can also be good indicators of grassland quality, but in this case they were only identified to genus level due to their complex taxonomy and practical difficulties of identifying them (even with microscopy), except where the species has readily distinguishable features. It was possible to identify many of the species during the site survey, but some could not be determined in the field and had to be identified from specimens examined using a microscope. Other fungi were also noted incidentally during the survey, but as a lower priority and most were not identified to species level except where they were readily identifiable in the field.

Fungi taxonomy is currently undergoing major revision as a result of DNA studies, and several of the previously well known names for grassland fungi are changing (e.g. waxcaps are now split into several different genera in some emerging classifications). For the purposes of this study the nomenclature follows Boertmann (2010) for waxcaps, Laessle & Petersen (2019) for earthtongues, and Kibby (2019) for Fairy Clubs.

The fungi were recorded by compiling a simple species list for each survey area. No attempt was made to quantify or map the fungi fruiting bodies within each area.

Figure 1. Location of fungi survey areas.

3. Survey findings

A list of all the fungi species recorded during the survey is given in Appendix 1. Lists for the individual survey visits are presented in Appendix 2.

The findings included a total of 27 waxcap species, 5 species of earth tongues and 7 species of fairy clubs. Photographs of some of the key species are presented in Appendix 3.

A breakdown of the target species found in each area and a description of each area in relation to fungi habitat is given in the following section. (A few additional non-target species have also been included, where they are used in some fungi assessment methods.)

Area 1

Area 1, showing patchy mix of acid grassland, heath and scrub.

Target fungi species in Area 1

- *Hygrocybe conica*
- *Hygrocybe laeta*
- *Hygrocybe pratensis*
- *Hygrocybe psittacina*
- *Hygrocybe substrangulata*
- *Hygrocybe virginea*
- *Glutinoglossum glutinosum*

Area 1 is a soil mound that is developing a cover of acid grassland with patchy heath and scrub. It appears to be in the region of 25 to 30 years old (although this was not confirmed).

Grassland fungi were relatively sparse on all of the survey visits; the most frequent species were *H.pratensis* and *H.psittacina*.

Area 2

Area 2, looking north-east from nearby soil mound.

Target fungi species in Area 2

- *Hygrocybe calyptriformis*
- *Hygrocybe cantharellus*
- *Hygrocybe chlorophana*
- *Hygrocybe citrinovirens*
- *Hygrocybe conica*
- *Hygrocybe flavipes*
- *Hygrocybe glutinipes*
- *Hygrocybe lacmus*
- *Hygrocybe laeta*
- *Hygrocybe pratensis*
- *Hygrocybe psittacina*
- *Hygrocybe reidii*
- *Hygrocybe splendidissima*
- *Hygrocybe virginea*
- *Clavulinopsis fusiformis*
- *Clavulinopsis helvola*
- *Clavulinopsis luteoalba*
- *Dermoloma cuneifolium*
- *Entoloma* sp.

Area 2 is a field of grazed pasture on natural ground. It supports semi-improved neutral grassland, grading into semi-improved acid grassland, with occasional trees and scrub.

Grassland fungi were easily found on every survey visit, with *H.pratensis* and *Clavulinopsis fusiformis* being locally abundant. The greatest numbers of fungi were found in the mid-slope section. A patch of the locally uncommon species *H.lacmus* was present near the eastern end. This was the only part of the study area where *H.splendidissima* was recorded.

Area 3

Area 3, showing typical short turf over coal spoil, and patchy heath and scrub.

Target fungi species in Area 3

- *Hygrocybe acutoconica*
- *Hygrocybe calciphila*
- *Hygrocybe cantharellus*
- *Hygrocybe ceracea*
- *Hygrocybe chlorophana*
- *Hygrocybe conica*
- *Hygrocybe insipida*
- *Hygrocybe miniata*
- *Hygrocybe mucronella*
- *Hygrocybe phaeococcinea*
- *Hygrocybe pratensis*
- *Hygrocybe psittacina*
- *Hygrocybe quieta*
- *Hygrocybe reidii*
- *Hygrocybe russocoriacea*
- *Hygrocybe substrangulata*
- *Hygrocybe virginea*
- *Clavulinopsis corniculata*
- *Clavulinopsis helvola*
- *Geoglossum fallax*
- *Glutinoglossum glutinosum*
- *Trichoglossum hirsutum*
- *Dermoloma cuneifolium*
- *Entoloma sericellum*
- *Entoloma sp.*

Area 3 is an area of coal spoil at Onllwyn Washery. It supports a mix of sparse vegetation, with areas of developing heath and scrub. Much of the surface is damp with patchy rushes. The vegetation appears to be in the region of 20 to 30 years old, but this was not confirmed.

Grassland fungi were patchily distributed, with most being found in the better drained areas with the sparsest vegetation, particularly on the eastern slope. The fungi included several small red waxcap species in the very short turf, including *H.miniata* and the locally uncommon species *H.phaeococcinea* and *H.substrangulata*. The presence of *H.calciphila* and *H.mucronella* may indicate a high base mineral content to the substratum, as these are often found in lime-rich habitats. In the absence of management it is possible that several species could be lost to natural successional processes as the vegetation closes and becomes taller.
