

- ① Areas of wet woodland that are being cleared, a total of 404.9 sq. m. This will be compensated for elsewhere on the development.
- ② A mix of five native species already found on site will be planted as compensation for the loss of wet woodland and provide vital habitats for local wildlife. A total of 407.03 sq. m of woodland will be planted.
- ③ Existing grassland to be retained as an important ecological resource.
- ④ New areas of wildflower meadows and grassland will be very attractive to pollinators which will benefit other forms of wildlife such as birds and reptiles.
- ⑤ Of the plants species used in ornamental planting, trees, hedges, and native understorey planting, 90% of those are either native and/or have benefits for wildlife.
- ⑥ An area of reed planting offers another fantastic habitat for local wildlife. Exact species TBC.

10 bird boxes will be constructed and fitted to trees as support for local bird species. Boxes will be to Ecologist's specifications and exact locations to be agreed on-site by ecological clerk of works.
