Standing seam systems

Standing seam roof systems are over 60 years old and involve the 'zipping up' of a rolled side lap over supporting halters. The sheet side laps are closed using a Mechanical Seaming Tool to rollform the 'Fixed Seam Overlap Radius', creating attachment to the halter but still allowing free movement under thermal expansion.

The Standing seam outer sheet can be produced in various metals and finishes, Aluminium is the most cost effective, our system range features predominately Aluminium Standing Seam Roof Systems. Our standing seam roof systems can be purchased with a system guarantee up to 25 years when installed as an ELITE System.
