PRELIMINARY INVESTIGATION REPORT

carried out at

MARDON PARK

PORT TALBOT SA12 7AX

Prepared for

GREENBUILD CONSULT

29 Bocam Park

Old Field Road

Pencoed

CF35 5LJ

Contract: 70491

Date: September 2018

EXECUTIVE SUMMARY

On the instructions of Greenbuild Consult, a Preliminary Investigation in the form of a desk study and site reconnaissance has been carried out in order to assess the potential hazards on and adjacent to the site and prepare a risk assessment for further consideration.

It is understood that it is proposed to develop the site for a light industrial facility.

The site is situated on the south western side of Central Avenue, south east of Mardon Park, northwest of Road Number 3, Port Talbot and may be located by National Grid Reference SS 740 926.

At the time of the walkover survey, the site was sensibly level and vacant consisting mainly of rough grass. A number of trees and an industrial estate were located to the north west of the site and a small electrical substation and a pumping station were present to the north east. The electrical substation and the pumping station were recent installations to supply the industrial estate.

The site appears to have been vacant from before 1880 however the word 'works, was present in the north west of the site in 1993 and 1995 but no buildings were indicated. Baglan Bay appears to have been back filled with material from the steel works to the north which may have also been deposited on the site. A rifle range was located on the southern half of the site and the northern quarter was marsh and below the mean high water mark prior to 1918.

The 1:50000 British Geological Survey map, Sheet No. 247 indicates the site to be underlain by Estuarine Alluvium overlying Middle Coal Measures. The Big Coal seam was also indicated to the north of the site.

The guidance recommends that basic radon protective measures should be installed in the proposed development in line with the Building Research Establishment, Report BR211.

The Geological Map indicated that Big Coal Seam is located to the north of the site. The north of the site is in a high-risk area as defined by the Coal Authority. It is recommended that a report is obtained from the Coal Authority.

There is evidence for the potential for radon to be present at levels for which basic protection measures have been recommended. The risk to end-users is considered to be high.

There is a potential risk from the made ground placed on the site from the steel works to the north. The risk is considered to be moderate.

There is the potential for the migration of explosive gases from the nearby filled ground, although taking into account the underlying geology (anticipated to comprise relatively

impermeable clay) and distance from the site, there is 'unlikely' to be a valid pathway and as such, the risk is considered to be moderate to low and no further investigation is considered necessary.

There is the potential for the migration onto site from contamination associated with rifle range. The risk to end-users is considered to be low.

The following scope of works is suggested in order to collect the required data:

- The sinking of trial pits for the recovery of samples for geotechnical and chemical contamination analysis.

1.0 INTRODUCTION

1.1 General

- 1.1.1 On the instructions of Greenbuild Consult, a Preliminary Investigation in the form of a desk study and site reconnaissance has been carried out in order to assess the potential hazards on and adjacent to the site and prepare a risk assessment for further consideration.
- 1.1.2 It is understood that it is proposed to develop the site for a light industrial facility.
- 1.1.3 This report has been prepared for the sole use of the Client for the purpose described and no extended duty of care to any third party is implied or offered. Third parties using any information contained within this report do so at their own risk.
- 1.1.4 It is recommended that a copy of this report be submitted to the relevant authorities to enable them to carry out their own site assessment and provide any comments.
- 1.1.5 The comments given in this report and the opinions expressed herein are based on the information obtained from the desk study and site reconnaissance. No intrusive investigation has been carried out to confirm the actual ground or environmental conditions.
- 1.1.6 Any risks identified in this report are perceived risks based on information reviewed. Actual risks can only be assessed following a physical investigation of the site.
- 1.1.7 This report has been based, in part, on information supplied by others. The report has been prepared on the basis of that information being accurate.
- 1.1.8 The conclusions presented in this report are based on the guidance available at the time of preparation of the report. No liability can be accepted for the retrospective effects of any changes or amendments to legislation or guidance.
- 1.1.9 This Preliminary Investigation has been conducted in general accordance with CLR 3, ref. 8.1, CLR 11, ref 8.2, BS 10175, ref 8.3, and GPLC 1, ref 8.4.

2.0 SITE

2.1 Site Location

- 2.1.1 The site is situated on the south western side of Central Avenue, south east of Mardon Park, northwest of Road Number 3, Port Talbot and may be located by National Grid Reference SS 740 926. A site location plan and is included in Appendix 1, Figures A1.1.

2.2 Site Walkover and Description

- 2.2.1 A walkover survey of the site was conducted on 21st August 2018. The walkover was carried out in general accordance with CLR 2, ref. 8.5.
- 2.2.2 The site is L-shaped and approximately 4 Hectares in area.
- 2.2.3 At the time of the walkover survey, the site was sensibly level and vacant consisting mainly of rough grass. A number of trees and an industrial estate were located to the north west of the site and a small electrical substation and a pumping station were present to the north east. The electrical substation and the pumping station were recent installations to supply the industrial estate.
- 2.2.4 A factory producing beauty products was present to the south east of the site and a small pond and trees were located to the north east. The area to the south west was vacant.
- 2.2.5 Photographs from the walkover survey are included within Appendix 2, Figure A2.1. A site plan is included in Appendix 1, Figure A1.2.

2.3 Historical Maps

2.3.1 A review of the history of the site has been conducted based on readily available historical maps. Details of the findings are provided in the table below. All maps are provided in Appendix 4.

Map, Date and Scale	Site Description	Regional Setting
Glamorganshire 1880 1:2500	The site was unoccupied although it was indicated to be covered in heath land with marsh in the northern quarter. A rifle range was indicated in the western corner of the site. The mean high-water mark crossed the northern arm of the site which was the boundary between heathland and marsh.	The area around the site was indicated to be heathland or marsh.
Glamorganshire 1884 1:10560	No significant changes	Baglan Bay was located north of the site and in the northern quarter of the site.
Glamorganshire 1899 1:2500	No significant changes although the rifle range was also located in the centre of the site.	The Rhondda and Swansea Bay Railway line was located 150m west of the site.
Glamorganshire 1918 1:2500	The rifle range was located in the south of the site with targets in the middle of the site. A tramway crossed the middle of the site from east to west.	The tramway terminated at the railway line east of the site. two ponds were located 50m and 150m south of the site. The mean high water mark was not present in the north of the site and the marsh was called 'Saltings'. The area to the south west of the site was indicated to be sand
Glamorganshire 1921 1:10560	No significant changes	The mean high-water mark appeared to be 500m north of the site.
Glamorganshire 1937 1:2500	No significant changes	No significant changes
Glamorganshire 1938 1:10560	No significant changes	No significant changes
Aerial Photograph 1949	The site appeared to be vacant although some sand dunes appeared to be present in the southern half of the site. The tramway appeared to be a track only.	The area around the site appeared to be vacant.
Glamorganshire	The tramway was indicated to be a track	A football ground was located to the north east of the site. a steel sheet and galvanising works

Map, Date and Scale	Site Description	Regional Setting
1951 1:10560		located 500m north of the site. and it appears that the slag from the steel works was used to fill Baglan Bay.
Ordnance Survey Map 1964 1:10000	No significant changes	No significant changes
Ordnance Survey Map 1979/70 1:2500	The site was vacant although a track crossed the middle of the site at the same location as the former tramway.	No significant changes
Ordnance Survey Map 1980 1:10000	The site was vacant	The access roads around the perimeter of the site had been constructed and the Baglan Industrial Estate was located to the south west and south east of the site. Railway lines were also located 100m north west of the site. A triangular reservoir was also present 200m north east of the site.
Large Scale National Grid Data 1993 1:1250	The site was vacant although the word 'works' was located in the north western corner of the site.	No significant changes
10K Raster Map 1999 1:10000	No significant changes	The steel works to the north of the site was not indicated. The M4 was present 400m east of the site.
Aerial Photograph 2000	The site was unoccupied.	The pumping station and the electricity substation were present to the east of the site. the areas around the site were vacant although the access roads were present around the site.
10K Raster Map 2006 1:10000	No significant changes	Two industrial units were present 100m and 200m south of the site and electricity transmission pylons were located north and west of the site. a sewage pumping station was present 450m north of the site.
Vector Map Local 2018 1:10000	The site was unoccupied.	The Marden Park Industrial Estate is indicated to the north of the site. The pond and Technium Centre are present north east of the site. A large industrial building is located 200m north west of the site which manufactures tissue paper and related products. A small power station is also located 500m south west of the site.

2.4 Summary

- 2.4.1 The site appears to have been vacant from before 1880 however the word 'works, was present in the north west of the site in 1993 and 1995 but no buildings were indicated. Baglan Bay appears to have been back filled with material from the steel works to the north which may have also been deposited on the site.
- 2.4.2 A rifle range was located on the southern half of the site and the northern quarter was marsh and below the mean high water mark prior to 1918.

3.0 SITE SETTING

3.1 Geological Setting

- 3.1.1 The 1:50000 British Geological Survey map, Sheet No. 247 indicates the site to be underlain by Estuarine Alluvium overlying Middle Coal Measures. The Big Coal seam was also indicated to the north of the site.

3.2 Hydrogeological Setting

- 3.2.1 The hydrogeological records, provided by the Environment Agency, indicate that the site is situated on a Secondary A Aquifer and a Secondary Undifferentiated Aquifer relating to the Alluvium. The bedrock is defined as a Secondary A Aquifer by the EA.
- 3.2.2 The Environment Agency has assigned the term Secondary Undifferentiated to aquifers where it has not been possible to attribute category A or B due to variable characteristics of the rock type.
- 3.2.3 The Environment Agency defines Secondary A aquifers as 'permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers'.
- 3.2.4 The Envirocheck vulnerability map indicates the soil to be of high leaching potential. However, low permeability drift deposits (the Estuarine Alluvium) are located over the aquifers.
- 3.2.5 Soils of high leaching potential are soils that readily transmit liquid discharges because they are either shallow or susceptible to rapid by-pass flow directly to rock, gravel or groundwater.
- 3.2.6 The site is not located within a groundwater source protection zone.
- 3.2.7 There are no groundwater abstraction wells within 1km of the site.

3.3 Hydrological Setting

- 3.3.1 The nearest surface watercourse is a small drainage ditch in the north eastern boundary of the site.
- 3.3.2 The site is situated within an area defined by the Environment Agency as being at risk of flooding from rivers or the sea at the extent of extreme flood. However the flood map from the EA indicates that this only applies to the northern corner of the site.
- 3.3.3 There is no available river quality classification data for the nearest watercourse.
- 3.3.4 There are no surface water abstractions within 1km of the site.

3.4 Radon

- 3.4.1 The British Geological Survey, in conjunction with the Radiation Protection Division of the Health Protection Agency, ref. 8.6, indicates the site to lie within an area where there is a probability of 3% to 5% of present or future homes being above the action level of 200Bq/m³. As such, the site is classified as a Radon Affected Area.
- 3.4.2 Therefore, the guidance recommends that basic radon protective measures should be installed in the proposed development in line with the Building Research Establishment, Report BR211, ref 8.7.

4.0 ASSESSMENT OF GEOTECHNICAL RISK

4.1 Geological Constraints

4.1.1 The following are brief findings relating to factors identified during the research from the Envirocheck data that may have a potential impact upon the engineering of the proposed development.

Potential Hazard	Assessed Risk	Comment
BGS Recorded Mineral Sites	Low	None within 500m
Coal Mining / Mining Instability	High	The Geological Map indicated that Big Coal Seam is located to the north of the site. The north of the site is in a high-risk area as defined by the Coal Authority. It is recommended that a report is obtained from the Coal Authority.
Other shallow mine workings	Very low	
Man-Made or Natural Cavities	Very Low	
Collapsible Ground	Very low	
Compressible Ground	Moderate to high	Alluvium likely to include peat or soft silt
Ground Dissolution	No Hazard	
Landslide	Very Low	The site is level
Running Sand	Low	High below water table
Shrinking or Swelling Clay	No Hazard	

4.2 Mining

4.2.1 The Geological Map indicated that Big Coal Seam is located to the north of the site. The north of the site is in a high-risk area as defined by the Coal Authority. It is recommended that a report is obtained from the Coal Authority.

4.3 Geotechnical Risk Assessment

4.3.1 An assessment of the main hazards associated with the site is detailed below. Unless stated otherwise, the presence of such hazards are based on information from the research or reconnaissance and have not been confirmed by an intrusive investigation.

- Soil Conditions

The Geological Map indicates the site to be underlain by Estuarine Alluvium Overlying Middle Coal Measures. The Alluvium is likely to be highly compressible and piles are a likely foundation solution for the proposed structure.

- Topography

The Envirocheck data provided indicates only a very low risk of landslip subsidence.

- Previous Use

Historical mapping indicates the site may have been filled using waste from the steel works to the north. This particularly applies in the north of the site. Some made ground should be expected over the site particularly in the north.

4.4 Conclusions of Geotechnical Risk Assessment

- 4.4.1 The research has identified evidence of potential hazards associated with underlying ground conditions, either natural or man-made, and therefore it is recommended that further work be carried out to confirm the presence, nature or extent of those hazards anticipated to impact on the site.

5.0 ENVIRONMENTAL SEARCHES

5.1 Potential Sources of Contamination

5.1.1 A search was made of records held by the various regulatory authorities and other statutory bodies to determine the presence or otherwise of past and current activities on or within 500m of the site which have the potential to give rise to the presence on site of contaminants. The findings are given in the table below:

Activity	On Site	Off Site (distance / direction)	Detail
Contaminated Land Register Entries	None	None within 450m	Shell Pinetree at 458m east of the site but notice revoked in 2004
Discharge Consents	None	Three at 250-500m	Closest at 411m north of the site which is sewage discharge to Swansea Bay.
Integrated and Local Authority Pollution Prevention and Controls	None	One at 34m north of the site and seven at 250-500m	Closest relates to unit 23 Mardon Estate which is a Pollution Prevention Control for a small waste oil burner.
Pollution Incidents to Controlled Waters	None	None within 500m	
Prosecutions Relating to Authorised Processes or Controlled Waters	None	None within 500m	
Registered Radioactive Substances	None	None within 500m	
Substantiated Pollution Incident Register	None	None within 500m	
BGS Recorded Landfill Sites	None	None within 500m	
Historical Landfill Sites	None	None within 500m	
Licensed Waste Management Facilities	None	None within 500m	
Local Authority Recorded Landfill Sites	None	None within 500m	
Registered Landfill Sites	None	None within 500m	
Registered Waste Transfer Sites	None	None within 500m	
Registered Waste Treatment or Disposal Sites	None	None within 500m	
Hazardous Substances	None	COMAH and NIHHS site at 300m south of the site	BP Chemicals Ltd, Baglan Bay Works - not active now.
Explosive Sites	None	None within 500m	

Activity	On Site	Off Site (distance / direction)	Detail
Contemporary Trade Entries	None	Five within 250m, eleven at 250-500m	Closest at 30m north of the site which is a fork lift truck manufacturer/supplier. A hydraulic engineer is located 91m north of the site
Fuel Station Entries	None	One at 419m east of the site	Texaco filling station now closed.

5.2 Designated Sites

5.2.1 The enquiries indicated there are no Sites of Special Scientific Interest (SSSI), National Nature Reserves (NNR) or Local Nature Reserves (LNR) within 1km of the site.

5.3 Nitrate Vulnerable Zone

5.3.1 The site is not located within an area designated as a nitrate vulnerable zone.

6.0 ASSESSMENT OF GEOENVIRONMENTAL RISK

6.1 General

- 6.1.1 The definition of ‘contaminated land’, along with the relevant details on legislation and guidance is set out in Appendix 3.
- 6.1.2 The assessment of potential risk has been based on the guidelines given in CIRIA report C552, ref 8.8. These guidelines are summarised in Appendix 3.
- 6.1.3 The assessment of environmental risk is aimed at identifying the possible risk, if any, arising from substances used or deposited on the site, or from any other sources of land contamination, based on the principles of the pollutant linkage.
- 6.1.4 The assessment is based on the proposed development end use, taking account of present and previous use. It is based only on a review of historical maps, desk based data and site reconnaissance; therefore it contains some elements of conjecture based on professional judgement. A comprehensive risk assessment can only be made following an intrusive investigation and testing regime.
- 6.1.5 The proposed development comprises light industrial facility with car parking around the structure.

6.2 Potential Sources of Contamination Identified

- 6.2.1 The research has identified the following potential sources of contamination which may form part of a pollutant linkage:
 - Contamination associated with former rifle range on the site.
 - Contamination associated with Made Ground due to filling of the north of the site.
 - Potential gas associated with made ground being placed on the area to the north and alluvium below the site.
 - Radon

6.3 Potential Pathways Identified

- 6.3.1 The research has identified a number of potential pathways which are relevant to the potential sources of contamination identified above and may form part of a pollutant linkage.
- 6.3.2 Those identified are detailed within the Conceptual Site Model, along with the receptors relevant to the development on a site specific basis.

6.4 Hazard Identification

- 6.4.1 The research has identified a number of potential sources and pathways which are considered ‘likely’ to be present which, taking into account the potential receptors identified, form potential pollutant linkages and have been used in the formulation of the Conceptual Site Model.

6.5 Hazard Assessment

6.5.1 An assessment of the main sources of contamination and the potential for unacceptable risk to receptors is detailed below. Unless stated otherwise, it is considered 'likely' that a potential source is present at this stage, in order to provide a preliminary estimation of the risk and therefore determine the need for further work.

- Human Health

There is evidence for the potential for radon to be present at levels for which basic protection measures have been recommended. The risk to end-users is considered to be high.

There is a potential risk from the made ground place on the site from the steel works to the north. The risk is considered to be moderate.

There is the potential for the migration of explosive gases from the nearby filled ground, although taking into account the underlying geology (anticipated to comprise relatively impermeable clay) and distance from the site, there is 'unlikely' to be a valid pathway and as such, the risk is considered to be moderate to low and no further investigation is considered necessary.

There is the potential for the migration onto site from contamination associated with rifle range. The risk to end-users is considered to be low.

- Construction Material

There is considered to be a moderate to low risk due to chemical attack on construction materials emplaced within the Made Ground.

- Controlled Waters

The site is located on a Secondary A Aquifer but superficial deposits of low permeability are present below the site. As such, any consequence of contamination to the water environment is considered to be minor, and therefore a very low risk level has been assigned.

A drainage ditch is located in the east of the site and given the relatively impermeable nature of the geological conditions anticipated on site, there is considered to be a low risk to this water body.

6.6 Conceptual Site Model

6.6.1 The research has therefore identified the following pollutant linkages that require further consideration and have been used to formulate the Conceptual Site Model.

Potential Contamination Sources	Potential Contaminants of Concern	Potential Pathways	Receptor Group
Possible contamination associated with made ground	Inorganic Compounds - Metals - Cyanide Organic Compounds - TPH - PAH Others - Asbestos - Organic matter	- Dermal contact - Inhalation of contaminated dust - Vapour inhalation	Human Health - Site users - Construction workers - Maintenance workers - Neighbouring site users/general public
		Plant uptake and accumulation of contaminants	Ecology Landscaped areas
		- Lateral migration - Surface run-off - Infiltration	Controlled Waters - Surface waters - Groundwater - Tidal waters
		Direct contact of contaminants with building materials	Building Materials or Services - Concrete - Plastic pipes and services - Structural iron & steel work

6.7 Conclusions of Geoenvironmental Risk Assessment

- 6.7.1 The research has identified evidence of potential sources of contamination on or which may impact on the site, with plausible pathways to the likely receptors, and therefore potential pollutant linkages have been suggested.
- 6.7.2 It is recommended that further work be carried out to confirm the presence, nature or extent of any contamination which is anticipated to impact on the site.

6.8 Consultation

- 6.8.1 During development, consultation may be required for a number of reasons with a number of regulatory Authorities. The following provides an indication as to the most likely Authorities with which consultation may be required:
- **Local Authority.** There may be a planning condition regarding contamination and consultation will be required with a designated Contaminated Land Officer within the Environmental Health Department. The Local Authority is generally concerned with human health risks.
 - **Environment Agency.** Where a site is within a groundwater protection zone or has been designated as a special site, the Environment Agency is likely to be involved to ensure that controlled waters are protected.
 - **National House Building Council, NHBC.** Section 4.1 of the NHBC Standards, ref 8.9, requires land management to be addressed. For a new housing development to be approved by the NHBC, any contamination will require remediation accompanied by a validation report.
- 6.8.2 Based on the results of any consultation, there may be specific investigation and/or remediation requirements imposed by one or more of the Authorities.

7.0 RECOMMENDATIONS

7.1 Further Work

7.1.1 An intrusive investigation should be undertaken to address the issues raised in Chapter 4.0 and Chapter 6.0.

7.1.2 The following scope of works is suggested in order to collect the required data:

- The sinking of trial pits for the recovery of samples for geotechnical and chemical contamination analysis.

7.2 Other Considerations

7.2.1 There are several other areas of research which are beyond the scope of this report. All or none of the following may be applicable to the site, either on the outcome of consultation with a regulatory body or as a result of the research for this Preliminary Investigation. They include:

- **Archaeology.** Should the site be situated on or within an area of archaeological sensitivity, the advisor to the relevant local authority should be consulted. The requirement for an archaeological report may be identified within a planning condition, if appropriate, for the site.
- **Ecology.** There may be a requirement for a detailed ecological report, dependant on the type or size of the development, or due to evidence identified during the site reconnaissance or desk study. This requirement may be identified within a planning condition, or recommended within Section 7.0.
- **Unexploded Ordnance (UXO).** There may be a requirement for a UXO report, dependant on the site location, historical use and surrounding site history, as well as the type or size of the development. Areas of low potential for UXO may include rural greenfield sites, well away from any military installations; however this does not mean there is no risk in such areas. The risk increases within urban areas, particularly those with wartime installations and infrastructure (e.g. power stations, industrial centres). Clearly wartime military establishments and their close surroundings have to be classed as high risk. This requirement may be identified within a planning condition.

APPENDIX 3
ENVIRONMENTAL RISK

APPENDIX 3

ENVIRONMENTAL RISK ASSESSMENT

A3.1 STATUTORY FRAMEWORK AND DEFINITIONS

A3.1.1 The statutory definition of ‘contaminated land’ is defined in Part IIA of the Environmental Protection Act 1990, ref 8.10, which was inserted by Section 57 of the Environment Act 1995, ref 8.11, and came into force in England in 2000, as;

‘any land which appears to the local authority in whose area it is situated to be in such a condition, by reason of substances in, on or under the land, that:

(a) significant harm is being caused or there is a significant possibility of such harm being caused; or

(b) pollution of controlled waters is being, or is likely to be, caused’.

A3.1.2 In Scotland, this has been amended by the Water Environment and Water Services (Scotland) Act 2003, ref 8.12, to *‘significant pollution of the water environment is being caused or there is a significant possibility of such pollution being caused’.*

A3.1.3 The purpose of Part IIA was to help address the problems caused by historical contamination, with the voluntary remediation of such land encouraged without the use of the Act. The planning regime assists in this, with Planning Policy Statement 23: Planning and Pollution Control (PPS23), ref 8.13, published in 2004, setting out the minimum requirements for the remediation of land affected by contamination as *‘after carrying out the development and commencement of its use, the land should not be capable of being determined as contaminated land under Part IIA of the EPA 1990’.*

A3.1.4 The UK guidance on the assessment of contaminated has developed as a direct result of the introduction of these two Acts. The technical guidance supporting the legislation was originally summarised in a number of key documents collectively known as the Contaminated Land Reports (CLRs), a proposed series of twelve documents. Seven were originally published in March 1994, four more were published in April 2002, while the final guidance document, CLR 11 was published in 2004. CLR7 to 10 were withdrawn in 2008, with CLR 9 and 10 effectively replaced by the Environment Agency in the form of Science Reports SR2, ref 8.14 and SR3, ref 8.15.

A3.1.5 CLR11 remains valid and sets out the framework of the investigation process, with the overall approach one of risk management, with risk given the definition of *‘a combination of the probability or frequency, of occurrence of a defined hazard and the magnitude of the consequences of the occurrence’.* In establishing whether a site fulfils the statutory definition of ‘contaminated land’ it is necessary to identify whether the three essential elements of risk exist. These are defined as:

- A contaminant - a substance which is in, on or under the land and has the potential to cause harm or to cause pollution of controlled waters;
- A receptor - something which could be adversely affected by a contaminant, such as people, an ecological system, property or a water body; and
- A pathway – a route or means by which a receptor can be exposed to, or affected by, a contaminant.

A3.1.6 A *‘pollutant linkage’* may be defined as the link between a contaminant *‘source’* and a *‘receptor’* by means of a *‘pathway’*. There may be none, one or many pollutant linkages

existing on a site, which may utilise the same or different sources, pathways and receptors, which may change over the passage of time.

A3.1.7 Each pollutant linkage that exists in respect of the land in question must fulfil one or more of the following criteria:

- significant harm is being caused to the receptor in the pollutant linkage,
- there is a significant possibility of significant harm being caused to that receptor,
- there is (significant) pollution of controlled waters (the water environment) which constitute the receptor, or
- pollution of controlled waters is likely to be caused
- (there is a significant possibility of such pollution being caused).

A3.1.8 A pollutant linkage indicates that all three elements have been identified. The site can only be defined as 'Contaminated Land' under Part IIA if a pollutant linkage exists and the criteria above are met.

A3.1.9 The main potential receptors include:

- 1) Humans – current site occupants, construction workers, future site users and neighbouring site users.
- 2) Controlled Waters – surface water and groundwater resources
- 3) Property – including buildings, crops, livestock and pets
- 4) Ecological systems – including current/future site and neighbouring vegetation

A3.1.10 The main potential pathways to be considered include:

- a) Ingestion and/or inhalation.
- b) Uptake of contaminants via cultivated vegetables.
- c) Dermal contact
- d) Migration through permeable strata
- e) Drains or services
- f) Direct contact with building materials and services
- g) Fire and explosion

A3.2 ASSESSMENT METHODOLOGY

A3.2.1 The guidance proposes a four-stage assessment process for identifying potential pollutant linkages on a site. These stages are set out in the table below:

No.	Process	Description
1	Hazard Identification	Establishing contaminant sources, pathways and receptors (the conceptual model).
2	Hazard Assessment	Analysing the potential for unacceptable risks (what linkages may be present and what could be the effects?).
3	Risk Estimation	Trying to establish the magnitude and probability of the possible consequences (what degree of harm might result and to what receptors, and how likely is it).
4	Risk Evaluation	Deciding whether the risk is unacceptable.

A3.2.2 Stages 1 and 2 develop a ‘*conceptual model*’ based upon information collated from desk based studies, and reconnaissance of the site (a walkover survey). The walkover survey should be conducted in general accordance with CLR 2. The formation of a conceptual model is an iterative process and as such, it should be updated and refined throughout each stage of the project to reflect any additional information obtained.

A3.2.3 The extent of the desk based research and enquiries to be conducted should be in general accordance with CLR 3. The information from these enquiries is presented in a preliminary investigation report with recommendations, if necessary, for further work based upon the conceptual model. In the absence of specific information on contamination anticipated to be encountered, specific DoE ‘Industry Profiles’ provide guidance on the nature of contaminants relating to a variety of industrial processes and should be used as the basis for determining which contaminants are more likely to be present on a site.

A3.2.4 If potential pollutant linkages are identified within the conceptual model, an intrusive ground investigation and report will be recommended. The investigation should be planned in general accordance with CLR 4, and BS10175. The number of exploratory holes and samples collected for analysis should be consistent with the size of the site and the level of risk envisaged. This will enable a generic quantitative risk assessment (GQRA) to be conducted, at which point the conceptual model can be updated and relevant pollutant linkages can be identified.

A3.2.5 A two-stage investigation may be more appropriate where time constraints are less of an issue. The first stage investigation may be conducted as an initial assessment for the presence of potential sources, with the second being more refined in order to delineate or further characterise any contamination or the physical properties of the site.

A3.3 RISK EVALUATION

A3.3.1 The risk evaluation is a qualitative method for interpreting the data from the hazard estimation stage. It involves the classification of the:

- magnitude of the potential ‘consequence’ (severity) of the risk occurring and;
- magnitude of the ‘probability’ (likelihood) of the risk occurring.

A3.3.2 These are defined in the following sections:

A3.4 CLASSIFICATION OF CONSEQUENCE

Classification	Definition	Examples
Severe	Short-term (acute) risk to human health likely to result in 'significant harm' as defined by the Environment Protection Act 1990, Part IIA. Short-term risk of pollution (note: Water Resources Act contains no scope for considering significance of pollution) of sensitive water resource. Catastrophic damage to buildings property. A short-term risk to a particular ecosystem, or organism forming part of such ecosystem (note: the definitions of ecological systems within the Draft Circular on Contaminated Land, DETR, 2000).	High Concentrations of cyanide on the surface of an informal recreation area. Major spillage of contaminants from site into controlled water. Explosion, causing building collapse can also equate to a short-term human health risk if buildings are occupied.
Medium	Chronic damage to Human Health ('significant harm' as defined in DETR, 2000). Pollution of sensitive water resources (note: Water Resources Act contains no scope for considering significance of pollution). A significant change in a particular ecosystem, or organism forming part of such ecosystem, (note: the definitions of ecological systems within Draft Circular on Contaminated Land, DETR, 2000).	Concentrations of a contaminant from site exceed the generic, or site-specific assessment criteria. Leaching of contaminants from a site to a major or minor aquifer. Death of a species within a designated nature reserve.
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services ('significant harm' as defined in the <i>Draft Circular on Contaminated Land</i> , DETR 2000). Damage to sensitive buildings/structures/services or the environment.	Pollution of non-classified ground water. Damage to building rendering it unsafe to occupy (eg foundation damage resulting in instability).
Minor	Harm, although not necessarily significant harm, which may result in a financial loss, or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc). Easily repairable effects of damage to buildings, structures and services.	The presence of contaminants at such concentrations that protective equipment is required during site works. The loss of plants in landscaping scheme. Discoloration of concrete

A3.4.1 In theory, both severe and medium classification can result in death. The differential is that severe relates to short term risk while medium relates to long-term risk. Therefore, the classification of severe requires urgent action while medium may require urgent action but usually long term action would be sufficient.

A3.5 CLASSIFICATION OF PROBABILITY

Classification	Definition
High likelihood	There is a pollution linkage and an event that either appears very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term.
Low likelihood	There is a pollution linkage and circumstances are possible under which an event could occur However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term
Unlikely	There is a pollution linkage but circumstances are such that it is improbable that an event would occur even in the very long term

A3.5.1 For the purposes of this preliminary investigation, any source of contamination that has been identified by professional judgement as potentially impacting on the site has been classified as being 'likely' to be present, unless proven otherwise by intrusive investigation.

A3.6 COMPARISON OF CONSEQUENCE AGAINST PROBABILITY

A3.6.1 These classifications are compared to indicate the risk presented by each pollutant linkage. Once the consequence and probability have been classified they can be used to produce a risk category as below:

		Consequence			
		Severe	Medium	Mild	Minor
Probability	High likelihood	Very high risk	High risk	Moderate risk	Moderate/low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate/low risk	Low risk	Very low risk	Very low risk

A3.6.2 The action required for the classified risks are as follows:

Very high risk	There is a high probability that severe harm could a risk to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required
High risk	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term
Moderate risk	It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term
Low risk	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.
Very low risk	There is a low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.

APPENDIX 4

ENVIROCHECK REPORT

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Glamorganshire

Published 1877 - 1880

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Glamorganshire

Published 1884

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Glamorganshire

Published 1938 - 1952

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography Published 1949

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Swansea

Published 1976

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a numbered key describing their use. They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that are mapped.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2018

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
