

Technical notes to support drawing:

1. The main support 'sight screen' frame accommodates the slide in white canvas sheet during match days. This acts as a safety device to enable the batsman to focus on the cricket ball. The white canvas sheet is removed at the end of each game.
2. The white canvas sheet frame is 4910mm in length and consists of wheels at the top and a guide on the bottom which retains the frame within the top and bottom rail system. The sight screen frame is slid to the location of the cricket pitch strip being used that day.
3. The permanent posts are approx. 5500mm above ground. The foundation is 1000mm for each post.
4. The permanent frame mirrors the length of the existing cricket square and consists of 15 posts at 3000mm centres.
5. There are 8 X 10cm posts and 7 X 5cm posts incorporated into the design.
6. Material of construction is galvanised steel with galvanise steel frame to hold canvas sheet.
