

Maes Ty Canol – Biodiversity Enhancement.

The hedgerow on the right should be (augmented) where needed with native species of local provenance to increase and improve connectivity to the wider environment.

Dark flight and commuting corridors are commonly along tree boundaries and any tree/hedge lined paths and these will be preserved and enhanced as discussed.

The addition of a hedgehog gate in the back right hand corner of the fencing in every rear garden will to allow them to forage between houses and to increase their range.

Aerial site image (courtesy of Apple maps™)

The site can be found at *Grid reference:* SS 75284 93036 or *What3 words:* stone.needed.water

The red arrows show dark flight lines/corridors for bats, owls, and nocturnal mammals to use...lighting should avoid spilling here, to this end, lighting in rear gardens; if planned should be on passive IR triggered timers and the light bulbs should be 2700 kelvin and below (warm white) not cold (daylight) bulbs.

The green hedge on the right if planted up and augmented will mean that the site connects directly to the wider woodland and countryside a short distance to the north.
