

Zone 01 – Gnoll Ruins

OPPORTUNITIES:

1. Existing vegetation / scrub to be retained where possible to benefit wildlife.
2. Ornamental shrub planting to new soft landscaped areas including species known to be good for pollinators. This creates an attractive external environment and provides ecological benefits.
3. New wildflower meadow areas to be created around the edges of the ruins. This enhances the site and provides more biodiversity than the existing amenity grass.
4. Bat boxes to be included around the ruins to further enhance site ecology.
5. Removal of dead / dying trees from Group G1, allows other trees to develop and improves quality of group.

CONSTRAINTS:

1. Removal of existing trees 162, 163 and 166 for reasons noted in the Tree Report.
2. Removal of lower branches and lifting of canopies to achieve vista to Gnoll Cascade.
3. Removal of existing grassed areas to create more hard surfacing, improve access and create stage feature.
4. Removal of group of trees G3 for reasons noted in the Tree Report.

The Gnoll Ruins site involves the removal of a small number of poor quality trees as well as the loss of some areas of species poor amenity grass. The introduction of new shrub planting, wildflower meadow areas and bat boxes will enhance biodiversity and provide an appropriate level of mitigation for the site.
