## General Remarks

1. Position scanned with a CAT, Genny and GPR prior to excavation.
2. Groundwater encountered at 2.30m depth.

All dimensions in metres

Scale:

**1:25**

Method Used:

**Machine dug**

Plant Used:

**13 Ton Tracked Excavator**

Logged By:

| Terminated at 2.50mbgl due to pit instability. |    |      |         |       |                            |                                                                                                                                                                                  |                   |                         |

## General Remarks

1. Position scanned with a CAT, Genny and GPR prior to excavation.
2. Groundwater encountered at 2.1m depth.

## General Remarks

- Position scanned with a CAT, Genny and GPR prior to excavation.
- Tp moved south west due to concrete obstruction, suspected old building foundation

## General Remarks

1. Position scanned with a CAT, Genny and GPR prior to excavation.
2. Difficult to dig at 0.8m and 1.2m, breaker required.

## General Remarks

1. Position scanned with a CAT, Genny and GPR prior to excavation.
2. Groundwater encountered at 2.6m depth.

## General Remarks

1. Position scanned with a CAT, Genny and GPR prior to excavation.
2. No groundwater encountered.
3. Upon completion trial pit backfilled with arisings.

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.4                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                                                                                                              |                                                |                                                      |                                    |                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.3                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                      |                         |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.7                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                                                                                                              |                                                |                                                      |                         |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                      |                         |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.5                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.2                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                       |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.6                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.4                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                      |                         |                  |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.6                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.2                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.5                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                    |                           |                                                      |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                      |                         |                                                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                    |                           |                                                      |             |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                      |                         |                                                      |                  |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                      |                         |                                                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                      |                         |                                                      |                      |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                      |                         |                                                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                    |                           |                                                      |             |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                      |                           |                  |           |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                                |                  |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0.5                                               |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                          |                                    |                                                      |             |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                                |                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                          |                         |     |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |                      |                  |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                          |                         |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |                      |                  |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

| <b>Stage 1 gas flow - Peak (l/h)</b>                                                | 0                                                 |                                                  | <b>Note:</b> Flow should be recorded at 5 second intervals up to 30 seconds, 10 second intervals to 2 minutes and 30 second intervals up to 3 minutes or until steady-state readings are obtained. Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |                  |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                         |     |

Typically, steady state conditions occur within 30 seconds to a minute. The differential pressure reading (in Pa) should also be recorded during this period. |                                                                   |                                                |                                                         |                                |                  |
