

Re: Results of bat survey completed on an area within the Grandison Brook area.

In accordance with your request for due-diligence protected species safeguarding advice in advance of the felling and or other tree works. I performed a walk-over survey of an additional site as requested and an inspection of any Potential Roost Features (PRF's) on 17th April 2026. The area assessed is within the marked area on the map below as given to me on instruction of the work.

In summary, the findings of the assessment were that: **a)** no bat roosts or nesting birds were discovered during the inspection of any of the trees on the site **b)** the planned felling or other tree works would not have an impact on any roosting bats or nesting birds at the time of the survey.

This letter is an account of the and bat roosting survey undertaken on the 17th of April 2026

Inspection method

Potential bat roost features were subject to close inspection using a torch or a RIDGID CA300 endoscope using a 17mm or 9 mm lens as appropriate. Each feature was searched for evidence of nesting birds and roosting bats or evidence of a bat roost in the form of droppings, substrate cues and a distinctive odour.

Where features were located at height, a ladder was used to access them. Where a ladder could not be used a climbing inspection using rope and harness was undertaken.

Constraints

There were no constraints accessing the site or the trees within the highlighted area.

A full and clear assessment of the trees was able to be carried out.

Results and action taken – Nesting birds

No trees or potential features were noted to have nesting birds present at the time of the survey.

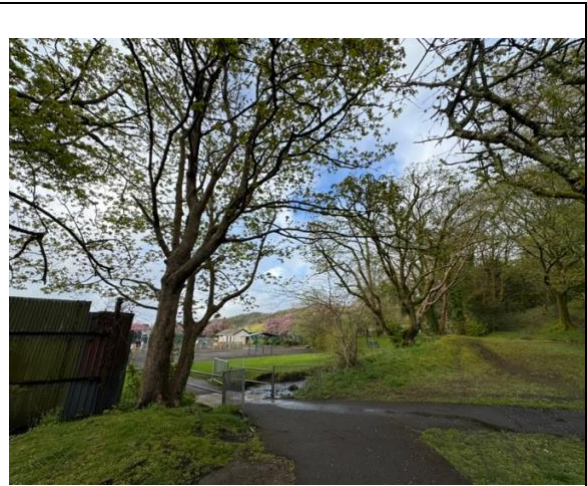

No further action was needed or taken.

Results and action taken – Roosting bats

No potential features were noted to have any features suitable for roosting bats at the time of the survey.

No further actions were needed or required.

Photos of the trees that were assessed below:

If you have any questions, please let me know.

**Yours sincerely
